Introduction

The purpose of this report is to provide an overview of research, Intelligent Transportation Systems (ITS) and technology transfer activities carried on throughout the Iowa Department of Transportation (DOT).

The Research and Technology Bureau (R&T Bureau) enhances Iowa DOT's ability to deliver efficient and effective transportation services by actively promoting research, university and industry partnerships, knowledge and technology transfer, ITS and information technology.

Bureau responsibilities include:

- 1. Coordinate, manage and administer the research portion of the State Planning and Research Program (SPR).
- **2.** Administer work of the Iowa Highway Research Board (IHRB) The IHRB program and SPR program are coordinated to ensure a continuing effective Iowa highway research program.
- **3.** Lead collaborative research efforts with FHWA, other states, universities and industry through national pooled funds and the Iowa Transportation Research Collaboration Agreement.
- **4.** Assist and lead department to identify, fund, manage, track and implement research.
- **5.** Participate in national and emerging regional ITS programs and administer ITS initiatives.
- **6.** Provide leadership for research and technology initiatives within the Iowa DOT.
- 7. Promote participation with other states in emerging research and technology such as 511 travel information system and Highway Advisory Radio/Low Powered FM.

Additional research, technology transfer and implementation activities are carried out in these other divisions and offices of the Department:

- The Office of Traffic and Safety administers the Iowa Traffic Safety Improvement Program as well as the Safety Management System, a diverse partnership of Iowa highway safety practitioners in engineering, enforcement, education, and emergency services dedicated to reducing the number and severity of crashes on Iowa's roadways.
- The Office of Maintenance conducts extensive research into winter weather operations and road weather reporting.
- The Office of Bridges and Structures administers the federally funded Innovative Bridge Research/Construction Program.
- The Living Roadway Trust Fund awards research and demonstration grants for integrated roadside vegetation management.

I. Research and Technology Bureau Programs

A. State Planning & Research Work Program (SPR)

Title 23 of the United States Code provides federal funding for state research programs by requiring that at least a minimum of ½ percent of certain federal funds apportioned to a state be used for research, development, and technology transfer (RD&T) programs. The R&T Bureau is responsible for formulating the research portion of the annual SPR plan, administering contracts, tracking progress, promoting pooled fund studies, and tracking implementation. The research portion of Iowa's SPR program has continued to grow (see *Attachment 1*) so that in FY 06 the total was \$2,876,059.

The research portion of the SPR program covers the four areas listed below. The numbers in parentheses indicate the function code applied to each area.

- General Administration (771) includes contributions to the Transportation Research Board and support of the DOT Library.
- Research and Technology Transfer (774) includes internal research projects as well as support for technical organizations (National Cooperative Highway Research Program, AASHTO committees, ITS groups), training, and special pilot or demonstration projects
- Research Support (775) covers the cost of specialized equipment purchased to accomplish a research project or to be tested itself.
- Pooled Fund Studies (776) covers the cost of contributions to regional and national studies in which multiple states participate.

Following in this section is a general description of each line item in the FY 06 SPR work program along with a brief statement of its impact on Iowa DOT operations.

The SPR work program (*Attachment 2*) represents a collaborative process of setting research priorities, selecting research activities, and reporting results. New projects are added from needs identified by various offices, solicitations by Federal Highway Administration (FHWA) and American Association of State Highway Transportation Officials (AASHTO), and invitations from individual sponsoring lead states throughout the year, upon approval from FHWA. *Attachment 3* illustrates the dollar amounts to SPR program categories. Each year's program is formulated to be diverse, including a variety of work areas such as design, construction, materials, maintenance, safety, structures, and environment. *Attachments 4A and 4B* show the distribution of SPR funding among various types of work.

General Administration (771)

The objectives of this section of the SPR program are to monitor transportation research activities at the national and regional levels, keep Department staff informed of current developments, prepare research proposals and work plans, administer research contracts, and provide assistance to staff and activities that support research in the department.

Transportation Research Board (**TRB**) – TRB conducts a variety of programs and activities designed to support dialogue and information exchange among researchers, practicing transportation professionals and others concerned with transportation. A more detailed description of Iowa DOT involvement in TRB can be found in Section III of this report.

→ *Impact:* Access to new nationwide research and technology developments.

DOT Library – The DOT library is jointly supported by the DOT and Iowa State University's Center for Transportation Research and Education (CTRE), with CTRE providing the staffing for the library. SPR funds are used to supplement CTRE staffing and to purchase books, periodicals and other relevant materials.

→ *Impact*: Support for Iowa DOT staff seeking broader knowledge and expertise.

Research and Technology Transfer (774)

Technology transfer means those activities that lead to the adoption of a new technique, process or product by users and involves dissemination, demonstration, training, and other activities that lead to eventual innovation. These activities foster research implementation, utilize staff expertise, and keep the transportation community apprised of the latest advances in the field.

CTRE Support – Iowa DOT support for CTRE ensures that research will be oriented toward real-world results and applications. A more detailed discussion of CTRE can be found in Section IV B of this report.

Research and Education Impact: Continued support for CTRE in turn provides continuing technology transfer assistance to the Iowa DOT with technology transfer activities.

AASHTO Partnerships – Iowa DOT supports four AASHTO cooperative projects: Product Evaluation (NTPEP), Approved Product Evaluation List (APEL), Technology Implementation Group, and Environmental Technical Assistance Program.

→ *Impact:* Access to nationwide knowledge, expertise, and new technology.

Nondestructive Evaluation of Iowa Pavements— This was the last year of the three-year project that uses data from nondestructive evaluation (Falling Weight Deflectometer) to develop models and software to assess pavement condition, estimate remaining pavement life, and evaluate rehabilitation strategies.

Impact: The software is especially valuable as Iowa DOT adopts the new AASHTO Pavement Design Guide.

ITS Programs – DOT staff participate in the national and regional ITS programs, ITS America and ITS Heartland. These alliances offer valuable opportunities for peer-to-peer exchange of ideas, information, and experiences. Collaboration on projects with neighboring states is enhanced via knowledge gained through the ITS affiliations.

→ *Impact:* Staff gains access to national data banks and knowledge about technology and projects undertaken by other states.

Remote Sensing – Remote Sensing is a long-term project for Iowa DOT. Remote sensing includes technologies such as aerial photography, satellite imagery, radar, or other technologies related to representing the surface of the earth, but is not limited to existing or even emerging technologies. Funds were provided to the Remote Sensing Coordination Committee for digital mapping of Pottawattamie and Mills Counties by the Omaha-Council Bluffs Metropolitan Area Planning Agency (MAPA).

→ *Impact:* Partnerships, training and upgrades of existing information and promoting more efficient and effective use of the technology.

PGA Research and Development – Pavement

performance issues sometimes relate to subgrade problems which can cause premature failure of the pavement system. The Partnership for Geotechnical Advancement (PGA) was established to identify and develop research, technology transfer, and education in geotechnical topics for Iowa. PGA members are the Iowa DOT, FHWA, CTRE, ISU's

Department of Civil, Construction and Environmental Engineering, and the Associated General Contractors of Iowa. A PGA goal is to increase pavement performance in a cost-effective manner by developing and implementing methods, materials, and technologies to solve highway construction or performance problems resulting from geotechnical problems.

PGA currently sponsors four research projects:

- Use of Ultra-High Performance Concrete in Geotechnical and Sub-structure Applications (TR-558)
- Measurements of Seasonal Changes and Spatial Variation in Pavement Subgrade Support Properties - A Link to Pavement Performance (TR-516)
- Optimization and Management of Materials in Earthwork Construction (TR-501)
- Embankment Quality (Phase IV) Application to Unsuitable Soils (TR-492)

In addition, the following PGA project was completed in FY 06.

- Field Evaluation of Compaction Monitoring Technology, Phase II
- → *Impact*: Longer lasting pavement with lower life-cycle cost.

Information Technology Development – This is a multi-year pilot project in which student programmers are hired through CTRE to develop several management tools for use in DOT. The initial project is Resource Management System (RMS), Daily Log phase. RMS will be used by maintenance staff for managing both human and physical resources. A future application to be developed is the Laboratory Information Management System (LIMS) for the Office of Materials.

Impact: New systems developed at lower cost to meet existing needs.

LRFD Development – The Office of Bridges & Structures is implementing LRFD specifications developed under a pooled fund study TPF-5(068). Manuals and design software have been purchased and training presented. LX series prestressed beam standards are being upgraded to LRFD. Training to be presented in FY 06 will include one day each on steel design, prestressed design, and using the program RCPier. The office is also working with the counties to set up a contract for updating the county continuous concrete slab standards and 3 span prestressed standards. As part of this update the superstructures will be updated to LRFD.

Impact: Ability to stay current with emerging national LRFD standards of bridge design.

Design Automation Manual – The Office of Design is developing an online Project

Automation Manual that will create comprehensive documentation and standardization for use of automation tools and processes. It will incorporate or be directly linked to information that will aid the user in applying current highway design practices and methodologies. This is the last year of the three-year project.

Impact: Ability of design staff to work with a higher level of effectiveness.

Scour Watch is a real-time web based system designed to analyze rainfall and stream flow data from the National Weather Service and US Geological Survey and warn maintenance personnel of potential problems on scour-critical bridges. It is estimated that Iowa has 220 scour-critical bridges on the state's primary road system.

Impact: Better bridge maintenance with less danger of bridge failures due to washouts.

Sign Management System, Phase I – The Sign Management System – Phase I, is helping

Iowa DOT develop a statewide inventory and management tool for roadway signs. Phase III (Implementation & Operations Plan) of the system will be funded in next year's SPR plans (FY 07).

→ Impact: More effective road sign management.

High Speed Intersection Crashes – This study evaluates the safety impacts of signal installation at high-speed intersections. A before-and-after analysis will be conducted to determine the impact on overall crashes as well as severity and type of crashes. Locations may include rural expressways but will cover all high-speed intersections.

→ *Impact*: Information to help plan safer intersection controls.

Guidelines for Treatment of Uncontrolled, Opposing Access in the Vicinity of Major Arterial Intersections – This study explores both good and bad practices and develop guidelines for providing access. Iowa has many miles of major arterial highways where atgrade access points are allowed to private land development. These are attractive for commercial development. If access is not well designed, the result can be serious safety and traffic flow issues.

→ *Impact*: Standardized access policies for safer and less congested roads.

Validating Crash Data – This study evaluates the crash reporting and recording process starting with the investigating officer and ending with interpretation of the resulting data. The objective is to determine whether the final crash database reflects the actual events, circumstances, and condition of crashes, resulting in accurate identification of problem locations, causes and mitigation strategies.

→ *Impact*: More accurate data from the analysis of crashes.

Synthesis for DOT Roundabout Guidelines – In this study researchers will perform a

synthesis of practice of modern roundabout guidelines and policies from other state DOT's that have successfully implemented roundabouts on their roadways. It will include guidance for both single and multiple lane roundabouts in urban and rural environments.

→ *Impact:* Standardized roundabout design practices.

Strategies to Address Wrong Way Maneuvers – Results of this study will support the decision-making process and range of alternatives for consideration in preventing wrong way maneuvers on all Iowa DOT roadways. It will address strategies currently used in Iowa DOT as well as in other states. The effort will document wrong-way crash

performance in Iowa and tie this to other roadway and location conditions such as time, location, and land use. A matrix will be produced showing where higher levels of warning might be appropriate and in what conditions.

→ Impact: Increased safety for the motoring public.

Lane Striping Grooving – This study is designed to test the ability of a shallow groove to protect the pavement paint against wear and increase the life of the line in selected sections of highway. Other variations of paint and beads will also be tested in other similar sections.

→ *Impact*: Longer lasting, longer reflecting pavement markings for safer roads.

Pavement Marking Technology – This new Maintenance study will help develop the

equipment, materials, methods, and analysis tools to improve the waterborne pavement marking program. The goals of the two-year project are to review current technology of the industry and other state DOT's, to investigate various configurations of paint guns, bead guns, and application methods, to develop pavement marking performance targets and replacement standards, and to provide appropriate pavement marking on all highways. The work program includes conducting a literature search, developing a workable prototype configuration of paint

guns and bead guns, and delivering an implementation plan for all six paint crews.

→ *Impact*: More efficient and cost-effective pavement marking for safer roads.

Proper Placement of Beads in Pavement Markings – The goals of the project are to review current technology of the industry and other state DOT's, to investigate other material application methods such as zero velocity deicing chemical spreaders, and to develop a bead gun that can consistently embed beads of various sizes in paint of various thicknesses at the appropriate depth without rolling or bouncing.

→ *Impact*: More efficient and cost-effective pavement marking for safer roads.

National Wetland Inventory – The National Wetland Inventory (NWI) is a critical GIS

layer used by the Office of Location & Environment (OLE) for location studies and Section 404 permitting. This layer is currently 20 years old and has had only sporadic updates. A \$1.5 million 5 year update project is in process now. National standards for the NWI require capturing streams and rivers, gravel pits, and sewage treatment lagoons. Additional features will be mapped based on input from Iowa wetland professionals: all surface water, including areas that are only temporarily or intermittently wet, and channels for rivers over 7 meters wide, producing a comprehensive Surface Water infrastructure inventory.

→ *Impact:* Once wetlands are mapped, many types of wetland assessments can be performed. Wetland assessment is crucial in order to make permit decisions, target voluntary restorations, maintain biodiversity, restore species, measure mitigation success,

undertake watershed management, protect public water supplies, and better implement local land use plans.

Snowplow Simulator – A pilot training project for truck/snowplow operators will be implemented combining detailed classroom instructions with a truck/snowplow simulator. The simulator package of driving scenarios and computer-based training courses will be housed in a mobile classroom, a trailer purchased with non-SPR funds. Maintenance employees will facilitate training and operate the equipment during the initial phase, while developing additional trainers in the field. Staff will work with CTRE to determine the viability of developing skills development,

evaluation, and assessment methods and to quantify the impact of the simulator experience in terms of preventable accidents by tracking pre and post-accident trends. It is anticipated it will take two years to develop, implement, test, and evaluate the system.

→ *Impact*: Better trained, safer, more effective winter maintenance operations staff.

Fast Track Paving Notch Replacement – In this study, researchers will develop a rapid

paving notch replacement that can be constructed in a single overnight closure of the bridge. A proposed paving notch replacement would consist of a precast concrete element that is connected to the rear of the abutment using high-strength post-tensioning rods and epoxy adhesive similar to that used for segmental bridge construction. Laboratory testing, field trial, and monitoring will follow the development phase. Approach pavement settlement at the end of the bridge has been observed on a number of Iowa bridges.

→ *Impact:* Repairs made with minimal traffic interruption.

3D Visualization – A specialized training series on 3D visualization will demonstrate the possibilities and benefits of using 3D visualization/animation techniques on in-house projects. Historically, this has been done by consultants at considerable cost (up to \$50,000 per project). Visualizations are an effective communication tool that the public is coming to expect. Structural contractors have asked for 3D details in plans for work that is not reliably illustrated in two-dimensional plans alone. This effort could help all contractors to more accurately bid the work to be performed, and help reduce errors and omissions on the jobsite.

→ *Impact:* Reduced cost of plan preparation with improved communication with contractors and general public.

Maintenance Expo – The Maintenance Expo, which is attended by about 400 front-line DOT employees (mostly equipment operators) who learn about new equipment, technology and methods for improving their maintenance functions.

→ *Impact:* This is the only opportunity equipment operators get to learn about developments from pooled funds such as Aurora, RWIS, SICOP, MDSS, and the Maintenance Concept Vehicle.

Technical Training and Conferences – The Iowa DOT has a high demand for technical training due to the nature of our work. Technology and best practices evolve constantly and require constant updating. Conferences attended using SPR funds are those at which the trainee will gain new technical knowledge directly applicable to his or her work. Employees who attend SPR-funded training and conferences must be working on a Federal-aid project, the cost must be reasonable and the training must be necessary to perform the federally funded work. Technical training is made available to DOT staff and to county and city staff when possible. In FY 06, a total of eight NHI and other technical courses were presented, attended by employees of Iowa DOT, FHWA, and local agencies. Six additional courses are planned but have not yet been held.

→ *Impact:* Better technically trained staff.

Research Support (775)

The objective of this section of the SPR program is to promote and provide support for essential priority research and data collection activities in support of further development of the highway engineering program. This permits purchase of equipment or software not normally used in day-to-day work of the department.

Dynamic Shear Rheometer – The objective of the use of the research grade rheometer is

to evaluate the proposed new test procedures in the AASHTO Pavement Design Guide. The device will be used to produce frequency sweeps, strain sweeps, stress sweeps, and temperature sweeps to evaluate the visco-elastic properties of asphalt binders used in Iowa. The research grade rheometer will also have the capability to evaluate the strain response of asphalt mixtures that can be correlated to rutting and fatigue of HMA pavements. It is expected that the results obtained will provide data needed to predict the performance of HMA containing both neat and modified binders and distinguish

between different types of modifiers.

→ *Impact:* Reduced cost of outside testing, better evaluation of asphalt mixes for lower life-cycle pavement costs.

Pooled Fund Studies (776)

According to Code of Federal Regulations 23 §420.205, "To promote effective use of available resources, the State DOTs are encouraged to cooperate with other State DOTs, the FHWA, and other appropriate agencies to achieve RD&T objectives established at the national level and to develop a technology transfer program to promote and use those results. This includes contributing to cooperative RD&T programs such as the NCHRP, the TRB, and transportation pooled fund studies as a means of addressing national and regional issues and as a means of leveraging funds."

Transportation Pooled Fund (TPF) study means a planning, research, development, or technology transfer activity administered by the FHWA, a lead State DOT, or other organization that is supported by two or more participants and that addresses an issue of significant or widespread interest related to highway, public, or intermodal transportation. A transportation pooled fund study is intended to address a new area or provide information that will complement or advance previous investigations of the subject matter.

Pooled fund studies are a very effective means of leveraging precious research funds. In FY 06 Iowa received the benefit of \$4.9 million in research for its investment of \$614,500 in pooled fund studies, a fourteen-fold return. See *Attachment 5* for an illustration of the investment leverage.

Iowa currently leads 13 national pooled fund projects and is an active participant in 15 others. Each pooled fund study and its anticipated impact are described here.

Iowa-led Pooled Fund Projects

ENTERPRISE – SPR-3(020)

The purpose of this project is to develop, evaluate, and deploy Intelligent Transportation Systems. Participants include eight other U.S. states, one Canadian province, Transport Canada, and the Dutch Ministry of Transportation. ENTERPRISE provides a forum for member agencies to communicate and pursue ITS projects that might be difficult to initiate on

their own. Statewide projects and the establishment of a 511 travel information program are two examples of areas that are of interest to members. ENTERPRISE is an ongoing project started in 1991 and has a \$250,000 annual budget. Its web site is www.enterprise.prog.org.

→ *Impact*: Safe, efficient, convenient, and socially and environmentally sound movement of people and goods.

Aurora – SPR-3(042)

The Aurora Program is a consortium of agencies focused on collaborative research, evaluation, and deployment of advanced technologies for detailed road weather monitoring and forecasting. Its projects result in technological advancement and improvement of existing Road Weather Information Systems (RWIS).

Participants include eight other U.S. states, two Canadian

provinces, and the Swedish National Road Administration. Aurora is an ongoing project started in 1995 and has an annual budget of about \$200,000. The Aurora Work Plan can be found at their website, www.aurora-program.org.

→ *Impact*: More efficient highway maintenance operations and safer winter driving conditions.

Highway Maintenance Concept Vehicle – SPR-3(060)

Four phases of this project to apply new technology to a maintenance vehicle have been completed. In Phase 5 which is co-sponsored by the Clear Roads pooled fund, researchers will investigate, design, and build a prototype snowplow to remove snow more efficiently than plows in use today. The plow developed in this project will have a contour-

following blade, or alternative to a blade, capable of clearing a roadway in one pass, reducing snow residue behind the plow, and plowing at a speed that is within ten mph of traffic speed-about 40-45 mph.

→ *Impact*: More effective ice and snow removal and safer winter driving for motorists and for maintenance personnel.

REPORT (CARS) – SPR-3(079)

The CARS (Condition Acquisition and Reporting System) consortium was formed to promote the deployment of road condition reporting systems and road weather prediction systems. The resulting CARS program is used in Iowa as described in the next section under ITS Projects. At present, fifteen states are members of the consortium. A description of the various aspects of CARS used by Joya and other states can be found at your care

of CARS used by Iowa and other states can be found at www.carsprogram.org.

→ *Impact:* Motorists can make critical decisions such as postponing a trip when road conditions are deteriorating or rerouting if an incident has closed a roadway.

Materials & Construction Optimization for Prevention of Premature Pavement Distress in Portland Concrete Cement (PCC) Pavement – TPF-5(066)

This study has undertaken examination and explanation of material compatibility, mixture troubleshooting, identification of quality procedures and implementable specifications for PCC pavements. The project is administered by the National Concrete Pavement Technology Center (CP Tech Center) at ISU on behalf of the Iowa DOT. Sixteen states and FHWA participate in the five-year project.

Private industry partners also contribute to the overall project. The total project budget including industry contribution and federal appropriation is over \$2.2 million. For more information, see www.cptechcenter.org/mco/.

→ *Impact:* More cost-effective pavement construction and longer lasting, more durable pavements.

Long-Term Maintenance of Load Resistance Factor Design (LRFD) Specifications – TPF-5(068)

LRFD incorporates state-of-the-art analysis and design methodologies for bridges with load and resistance factors based on the known variability of applied loads and material properties. The load and resistance factors are calibrated from actual bridge statistics to ensure a uniform level of safety. This project was begun by AASHTO in 2002 and was picked up by

Iowa as lead state. It has been so successful that in May, 2006, it was extended another four years beyond its original five-year duration. Currently forty-eight states are partners in the project. The project consultant assists the AASHTO Highway Subcommittee on Bridges and Structures in interpreting, implementing, revising, and refining the AASHTO *LRFD Specifications*.

→ *Impact:* Uniform service levels and bridge reliability resulting from using LRFD should ensure superior serviceability and long-term maintainability for bridges.

Smart Work Zone Deployment Initiative – TPF-5(081)

Through this five state pooled-fund study which began in 1999, researchers investigate better ways of controlling traffic through work zones. Work is accomplished via a variety of projects carried out by researchers in the member states. During the first four years of the study, a total of 35 technologies were deployed and evaluated. A list of past and current projects can be found at www.ctre.iastate.edu/smartwz/index.cfm.

→ *Impact*: Increased safety and efficiency of traffic operations and highway work.

Self-Consolidating Concrete – Applications for Slip Form Paving (Phase I) – TPF-5(098)

The goal of the research is to develop a new type of self-consolidating concrete (SCC) for slip form paving. Phase 1, a feasibility study, demonstrated that SCC holds its shape in the lab. The CP Tech Center provides administrative management with funding from four states, industry, and FHWA and is the lead research institution on the project. A solicitation was sent out in spring 2006 for Phase 2 which entails demonstration projects, lab study and performance monitoring.

→ *Impact*: More workable concrete and smoother pavements, better consolidation of the plastic concrete, and higher rates of production.

Deicer Scaling Resistance of Concrete Pavements, Bridge Decks and Other Structures Containing Slag Cement – TPF-5(100)

Ground granulated blast-furnace slag commonly replaces 20%-35% of the portland cement in cementitious mixtures. Concrete containing slag generally exhibits excellent long-term strength and durability, but it can scale with freeze-thaw cycles and application of deicing chemicals. Phase I of this project will document the field performance of existing concrete pavements, bridge decks, and other structures made with slag cement that have been exposed to cyclical freeze-thaw

cycles in the presence of deicing chemicals and determine which mixtures and construction parameters have produced scale-resistant concrete containing slag. Phase II will determine the effectiveness of ASTM C672 in predicting the deicer scaling behavior of field concrete. Five states, industry, and FHWA have committed funds for Phase I. The CP Tech Center provides administrative management and is the lead research institution on the project.

→ *Impact:* Improved durability of pavements.

Performance Properties of Ternary Mixes – TPF-5(117)

DOT's have used fly ash and ground granulated blast-furnace slag (slag cement) as a partial replacement for Portland cement in concrete production for many years, but few attempts have been made to optimize the use of fly ash or slag cement to produce concrete mixtures that meet specific performance objectives. This project will provide quantitative information needed to make sound engineering judgments pertaining to use of supplementary

cementitious materials in conjunction with Portland or blended cement. Project partners include six other states, FHWA and the CP Tech Center.

→ *Impact:* More effective utilization of supplementary materials and/or blended cements, enhancing the life-cycle performance and reducing the cost of transportation pavements and structures.

High Speed Pavement Analyzer – TPF-5(136) Begins in 07

The purpose of this project is to develop a device that will measure, at highway speeds, pavement structural condition which is known to impact the performance of PCC and composite pavements. Analysis of pavement distress and structural condition is a key component of all pavement management systems and provides a method to schedule rehabilitation and maintenance activities to minimize life-cycle

costs for these facilities. It is very costly and difficult to obtain the needed measurements over a large network of highways with current technology. Further, most current devices

require lane closures that cause disruption to the traveling public and expose field personnel to dangerous working conditions.

→ *Impact:* Safer and faster data collection technology that will contribute to better maintenance planning and operation.

Surface Characteristics – TPF-5(139)

One pressing issue for the PCC paving industry is surface characteristics, the properties of pavement that affect smoothness, friction, noise, drainage, splash and spray, rolling resistance, and reflectance. This study is the continuation of a comprehensive data collection and analysis program on new and existing pavements started in 2005. The research has produced a broader range of applicability and developed innovative texturing techniques with the potential to significantly reduce noise. Field sites consist of

both conventional and innovative texturing techniques. Project partners include three other states, FHWA, industry and the CP Tech Center.

→ *Impact:* Lower pavement noise, as well as acceptable levels of smoothness, friction, and safety.

Urban Teen Driver Study – TPF-5(144) Begins in FY 07

Newly licensed teens have an extremely high risk for crashes. The objective of this project is to examine the use of event-triggered video feedback to reduce urban teen unsafe driving. 'Unsafe events' will trigger the video system to begin recording a 20-second video and audio clip. Triggered events include situations where a driver exceeds a lateral or longitudinal physical limit, such as when abrupt accelerations, braking or erratic steering occurs. Data from the on-board diagnostics port,

such as speed, throttle position and brake activity may also be recorded and synched with the video clips. Parents receive a weekly report card of their teens driving that describes each event in narrative form. Coaching protocols for parents to use in discussing the unsafe events have been developed. It is hoped that improved safety in driving will result when 'report card' information is communicated between parents and teens.

→ *Impact:* New possibilities for educating both driver license examiners and driver education instructors, greater insight in how younger drivers use (and misuse) the state's roadways.

Pooled Fund Projects with Iowa Participation

Midwest States Crash Test Program – SPR-3(017)

The purpose of this program, established in 1990, is to crash test highway roadside appurtenances (guardrails, bridge rails, signposts, barriers, etc.) to assure that they meet criteria established nationally. Full scale crash testing is performed at the Midwest Roadside Safety Facility, University of Nebraska.

→ *Impact:* Safer roadsides and roadways.

Snow and Ice Control (SICOP) – TPF-5(009)

SICOP is the Snow and Ice Pooled Fund Cooperative Program developed by AASHTO (The American Association of State Highway and Transportation Officials).

SICOP is under the oversight of the Winter Maintenance Technical Service Program (WMTSP). The goals of the winter maintenance program are to (1)sustain or improve levels of winter maintenance

service with significant benefit/cost improvements, (2) provide an enhanced level of environmental protection, and (3) place technology in service on operational maintenance sections within two winter seasons.

→ *Impact:* Computer-based training used by Maintenance was developed under this pooled fund.

Base Funding for the North Central Superpave Center – TPF-5(021)

This pooled fund provides for continued operation of the North Central Superpave Center (NCSC) at Purdue University to assist agencies and industry with Superpave implementation and hot mix asphalt issues. The NCSC provides technical assistance, training, communication, and research and development work to meet the needs of the seven-state region.

→ *Impact:* Ready access to sophisticated research and testing capabilities with expertise and training in the area of HMA dynamic testing and surface friction

Falling Weight Deflectometer (FWD) Calibration Center – TPF-5(039)

Use of FWD's is increasing as states use the recently developed AASHTO Design Guide. Iowa is now entering the FWD testing field with two FWD units, requiring annual certification for Federal approval of test results. FWD devices require frequent calibration to provide reliable results. However, changes in computer technology have rendered some

FWD calibration equipment nearly obsolete. This pooled fund project involves updating the calibration hardware, software and procedures, as well as training and installation of the new calibration system in the four calibration centers (CO, TX, MN and PA).

→ Impact: Accurate data for programming pavement rehabilitation.

Transportation Curriculum Coordinating Council: Training Management and Development (TCCC) – TPF-5(046)

A well-trained workforce is a more efficient and effective workforce. With that goal in mind, the Transportation Curriculum Coordination Council (TCCC), formed in the summer of 2000, has dedicated itself to improving training opportunities for

transportation workers. The Council's goals also include developing a national core curriculum that can be used by any agency and building partnerships among State highway agencies and industry associations so as to save time and costs in developing training materials. For more information, visit http://www.nhi.fhwa.dot.gov/tccc/.

→ *Impact:* Current needs identified for this region include developing field construction courses, basic materials courses for maintenance staff, and train-the-trainer courses for lab technicians.

Midwest States Accelerated Testing Program – TPF-5(048)

The Civil Infrastructure Systems Laboratory at Kansas State University evaluates various pavement components such as bases, ACP and PCCP using full scale accelerated pavement testing as determined by the TAC. The load testing can be conducted under a variety of environmental conditions in short time frames due to the ability to place more loading cycles on the pavement than can be achieved on a highway during the same time period.

→ *Impact:* Conducting full-scale, accelerated testing of full-depth pavement section under realistic loading at a reduced operation cost.

Develop Maintenance Decision Support System – TPF-5(054)

Agencies can provide more effective maintenance, and provide it more efficiently, with the help of an automated Maintenance Decision Support System (MDSS) that could:

1) assess current road and weather conditions using observations and reasonable inferences based upon observations;

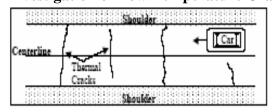

- provide time- and location-specific weather forecasts along transportation routes; predict how road conditions would change due to forecast weather and the application of several candidate road maintenance treatments;
- notify state agencies of approaching conditions and suggest optimal maintenance treatments that can be achieved with resources available to the transportation agencies; and
- 4) evaluate the reliability of predictions and the effectiveness of applied maintenance treatments for specific road and weather conditions so decision support can be improved.
- **→** *Impact:* Clearer assessment of conditions, more efficient winter operations.

Traffic Control Device (TCD) Consortium – TPF-5(065)

The TCD Consortium is composed of regional, state, local entities, appropriate organizations and the FHWA. Its goals are to

- establish a systematic procedure to select, test, and evaluate approaches to novel TCD concepts as well as incorporation of results into the Manual of Uniform Traffic Control Devices (MUTCD);
- 2) select novel TCD approaches to test and evaluate:
- 3) determine methods of evaluation for novel TCD approaches;
- 4) initiate and monitor projects intended to address evaluation of the novel TCDs;
- 5) disseminate results; and
- 6) assist MUTCD incorporation and implementation of results.
- → *Impact*: Assessment of new tools and technologies

Investigation of Low Temperature Cracking in Asphalt Pavements – TPF-5(080)

Low temperature cracking is the most prevalent distress found in asphalt pavements built in cold weather climates. The specification does a reasonable job predicting performance of conventional asphalt cements, but this does not hold true for polymer-modified asphalt binders

that are manufactured to reach very cold temperature grades needed in cold climates. Currently the low temperature specification considers only the asphalt binder. Specifications are being developed for the complete asphalt mixture. In addition, the significant effects of aging and moisture on crack formation and propagation are being investigated.

→ *Impact*: New specifications will allow for a better selection of asphalt binders and mixtures with respect to their resistance to crack formation and propagation.

Rural Intersection Decision Support System – TPF-5(086)

This research builds on recent advances in intelligent transportation systems (ITS) technology. The objective is to develop a better understanding of the causes of crashes at rural intersections and then develop a toolbox of effective strategies to mitigate the high crash rate. Drivers are often unable to correctly identify and select the gap

needed for safe passage. Efforts proposed in this program address rural intersection crashes through the application of a suite of advanced surveillance technology, algorithms which predict vehicle and gap location, and driver interfaces designed to best provide necessary information to drivers at intersections. The main program emphasis is on the integration of these key components into an effective, affordable system. Focus is also on alternatives to traditional traffic signals as a means to decrease the frequency and severity of rural intersection crashes.

→ *Impact*: Increased safety of rural intersections, reduced crashes and fatalities.

Clear Roads – TPF-5(092)

Clear Roads is an open, cooperative research program aimed at funding highly relevant research to meet the needs of winter operations professionals around the world. This is an ongoing pooled fund project that proposes and funds new research projects or related activities on an annual basis. The Technical Advisory Committee proposes new research projects for funding every year. Research projects currently underway are

- 1) Calibration Accuracy of Manual and Ground-Speed-Control Spreaders; and
- 2) Synthesis of Best Practices for Eliminating Fogging and Icing on Winter Maintenance Vehicles.

For more information see the project web site at www.clearroads.org

→ *Impact*: Improved winter maintenance techniques, safer winter driving conditions.

Evaluation of Low Cost Safety Improvements – TPF-5(099)

The scope of this study is to conduct a research project of priority strategies from all of the NCHRP Report 500 Guidebooks to help determine their effectiveness in reducing the number and severity of crashes. The data will be collected and evaluated as the strategies are implemented over the course of a few years. Initial measures studied include

- 1) Center two-way left turn lane for two and four lane roadways;
- 2) Flashing beacons at stop-controlled intersections;
- 3) Higher retro reflectivity sheeting for stop signs; and
- 4) Pavement markings with supplementary messages such as "stop ahead."

→ *Impact:* Implementation of more effective lower-cost safety improvements.

Midwest Pavement Preservation Project – TPF-5(112)

Many state, county, and local highway agencies are building experience and developing knowledge in design, materials, specifications, and performance criteria in the area of preservation. Developing national protocols for pavement preservation and publishing them as AASHTO standards will improve overall quality and treatment performance. This project provides for the exchange of information that is

invaluable to highway agencies. Exchange methods range from annual workshops, web sites, and formal training.

→ *Impact:* Quicker solutions for common issues, minimal effort duplication and wasted resources resulting from an ability to focus on common objectives, identification of common research needs, funding mechanisms, and priorities for the work studies and reduction of the states' program costs as a result of adopting common procedures, materials, and treatment specifications.

Deer Vehicle Crash Information Center – TPF -5(120)

A significant amount of money has been spent on the implementation and study of deer-vehicle crash (DVC) countermeasures in the last several decades, but their expected crash reduction effectiveness is still largely unknown. This pooled fund will create a focal point for the collection of DVC-related data/information (e.g., deer populations, vehicle travel, reported DVCs, and roadside carcasses). It will also guide, define, and fund an organized strategy of well-designed and properly staffed DVC-related research.

→ *Impact*: Clearer understanding of deer-vehicle crashes and countermeasures.

Accelerated Implementation of Intelligent Compaction Technology – TPF-5(128)

Compaction is a vital final step in the construction of quality, long lasting subgrade soils and pavement materials. Current compaction equipment and processes can result in inadequate and/or non-uniform material density, which shortens embankment and/or pavement service life. Implementation of IC technology may result in more uniform material density, improve the efficiency of compaction operations by reducing the number of passes

needed to obtain specification density and can provide a valuable tool in QC/QA.

- → *Impact*: The primary outcomes of the pooled fund project will be:
 - 1) Accelerated development of Intelligent Compaction (IC) QC/QA specifications or Subgrade Soils, Aggregate Base and Asphalt Pavement Material.
 - 2) Develop an experienced and knowledgeable IC expertise base
 - 3) Identify and prioritize needed improvements to, and/or research for, IC equipment and Field QC/QA testing equipment.

B. Iowa Highway Research Board

The Iowa Highway Research Board (IHRB) has provided a distinctive partnership for the Iowa Highway community with a collaboration of city, county, state and university research expertise and oversight. Pooling a portion of funds for research from the Primary,

Secondary, and Street Funds provides benefits to all levels of the Iowa highway community. Board membership includes representatives from Iowa's city and county government highway agencies, the Iowa DOT, and Iowa's public universities with civil engineering programs. Staff assistance is provided by the Iowa DOT.

The IHRB assists the Iowa DOT in the development and continuation of an effective program of research in highway transportation. Each year it oversees some 40 projects on transportation issues in Iowa. Most of the projects are conducted by state universities. The Board supports engineering research studies and projects on topics ranging from soils and structures to pavements, markings and winter maintenance. All are designed to find more efficient uses of funds and materials for the construction and maintenance of Iowa's highway system. Projects conducted under this program are summarized annually. The FY 2006 Annual Report is included as *Attachment 10* of this document. For additional information, visit the board's web site at: http://www.operationsresearch.dot.state.ia.us/.

C. Intelligent Transportation System (ITS) Projects

Transportation problems have historically been solved by investing in infrastructure and services. Governments now also turn to innovative solutions collectively known as ITS, applications of information and technologies to improve the movement of people and goods. These applications typically rely on computer and communication technologies, potentially resulting in shorter travel times, increased traveler information, more travel options, increased safety, and a more efficient flow of people and goods.

The Iowa DOT programs and coordinates ITS projects through the Research & Technology Bureau. Projects are funded primarily through the U.S. Department of Transportation's (USDOT) Congestion Management & Air Quality (CMAQ) program.

CARS/511 Implementation

Iowa's CARS/511 program began operation in November 2002 by providing travelers with winter road condition information.

I-235 internet site (www.i-235.com) and the internet sites of many local television stations.

Statistics on calls and web visits show much higher use of the 511 system during winter months, probably because winter weather and road conditions can change from hour to hour as well as from day to day.

CARS/511 Usage					
Month	FY 06 Calls	FY 05 Calls	FY 06 Web Visits	FY 05 Web Visits	
July	10,803	9,824	21,513	7,206	
August	9,487	9,929	20,280	7,114	
September	7,542	7,724	15,292	6,146	
October	7,728	7,874	13,600	5,072	
November	35,789	13,821	41,512	7,507	
December	96,121	17,595	70,677	8,184	
January	23,424	209,843	26,760	86,417	
February	36,153	29,071	31,685	32,819	
March	43,386	21,149	35,190	39,000	
April	10,244	9,321	19,997	24,053	
May	8,664	10,152	20,041	21,724	
June	9,594	12,200	21,812	28,022	
Total	298,935	358,503	338,359	273,264	

CARS is a situation reporting system software that allows state agencies to input information regarding road incidents, weather conditions and roadway conditions that are reported to the public. CARS is the software that runs the 511 web pages and voice-activated phone link. Any situation that affects the transportation network or a region can be entered into the CARS system. In 2006 plans were made to improve the system by developing modules to link with dynamic message signs (DMS) and highway advisory radio stations (LPFM).

Putting information into the system is a cooperative effort of the Office of Construction, Office of Bridges & Structures, every DOT District, and the Iowa State Patrol. Most CARS entries are made by selecting from pre-programmed phrases and options to create an event report message; however there is also a free-text screen for department-specific information. Users can also add information such as engineer contact information or project numbers to allow for details of key personnel involved in a project to be listed.

Fifteen states contribute to a pooled fund to maintain servers and continue development of the CARS system. The 511 website and dial-up system were developed by Castle Rock Consultants under contract with the multi-state consortium. CARS is compliant with the National Intelligent Transportation System Standards. This ensures that information entered in CARS may be transferable to other systems and is compatible across agencies.

I-235 (Des Moines) Traffic Management

ITS helps manage urban freeway traffic in Iowa. Implementation of a traffic management system will allow traffic managers to keep an eye on the road system and quickly notify motorists of problems they might encounter.

A system of pole-mounted radar sensors on highways in and around Des Moines transmits data on traffic flow and speeds. In addition to the sensors, video cameras with pan, tilt and zoom action provide information on traffic flow throughout the area. The system uses both wireless and fiber optic transmission. Direct connection to camera video is available to authorized DOT personnel, local agencies, and media outlets.

tripGuide Use						
	FY 06 511 Pages Visited*	FY 06 tripGuide Visited	FY 06 % tripGuide / Total	FY 05 % tripGuide to Total Visited		
July	39,283	10,273	26.34			
August	36,582	10,219	27.93			
September	25,445	8,277	32.53			
October	22,980	7,027	30.57			
November	77,445	17,450	22.53

Total	394,800	135,821	34.40	34.40		

Incoming data and visuals are monitored by DOT personnel in the I-235 office which serves as a transportation management center. Alerts can be automatically triggered by certain traffic conditions. Dynamic Message Signs (DMS) throughout the area can be triggered from a central site and alerts given to emergency personnel, DOT offices and maintenance shops, media and the public. Coordination through the transportation management center will help smooth the flow of traffic, reduce congestion, reduce accidents, and improve public safety in the metropolitan area.

By clicking the tripGuide icon on www.511ia.org or www.i235.com, the public can view a dynamic color-coded traffic flow map and camera images which are refreshed every 60 seconds. TripGuide has proved to be a very popular service. Since its inception, about 1/3 of the pages viewed on the Iowa DOT 511 web site have been tripGuide pages.

Eastern Iowa ITS Project:

The Eastern Iowa ITS Project entails deployment of ITS technology and systems in both the Iowa City and Quad Cities (Davenport-Bettendorf-Moline-Rock Island) metropolitan areas.

The technology included in these projects include pan-tilt-zoom cameras, traffic sensors, dynamic message signs (DMS), highway advisory radio (HAR) transmitters and, in the Quad Cities, ramp gates to control access to the I-74 Mississippi River Bridge. Using a combination of wireless and fiber optic communications, these devices are tied together by the traffic management software to form a network of technology which can be used to control the devices, manage traffic situations and provide timely information to the traveling public. Local media (TV and radio), along with Iowa DOT's radio broadcast systems and web sites, 511 phone calls, and DMS will be able to transmit current conditions and traffic flow information to drivers.

The Iowa City deployment will help address traffic needs anticipated during the reconstruction of Interstate 80, existing daily congestion on I-80 and I-380 and special event needs generated by University of Iowa athletic events.

The Quad Cities deployment will focus on the I-74 corridor crossing and approaching the Mississippi River. This corridor from Bettendorf to Moline experiences significant delay frequently due to traffic incidents on the high volume, narrow twin suspension bridges.

Both the Iowa City and Quad Cities projects are being developed in close coordination with local law enforcement, emergency responders and traffic officials. It is anticipated that access and use of the ITS networks will be shared with local officials.

Statewide Dynamic Message Signs (DMS)

A statewide system of DMS has been developed to provide on-site just-in-time information to the traveling public. The system is being designed for both traffic management (primarily congestion

mitigation) and for public safety (emergency operations, homeland security, amber alert, weather emergencies, etc.). DMS communications and messages will be coordinated with other states as well as with local governments and agencies. In actual practice it will function as more than merely a statewide system. Operations will be integrated with bordering cities and states such as Nebraska, South Dakota, and Illinois as well as metropolitan areas such as Omaha, Rock Island/ Moline, etc.

By June 2006, Iowa DOT had 23 DMS installed with 26 more locations identified for possible installation between FY 2007 and 2008. The DMS will be located primarily in urban areas on or near the interstate system. The plan will be reviewed annually and amended to maintain a 5 year outlook.

Regional Architecture

After April 8, 2005, no new ITS projects could advance without demonstrating compliance with a regional ITS architecture. Architecture defines the pieces of the ITS network being deployed, the stakeholders, the interconnections among those pieces and stakeholders, and the information being exchanged.

Iowa has 10 architecture efforts completed. A regional architecture was developed in each of the nine Metropolitan Planning Organizations (MPOs). They are Des Moines, Ames, Cedar Rapids, Council Bluffs, Dubuque, Iowa City, Sioux City, Quad Cities and Waterloo. A statewide architecture has also been developed to take into account statewide projects and areas outside an MPO.

Regional ITS architectures promote cooperation within the region for developing projects and for improving regional transportation planning. For example, a regional ITS architecture can improve regional transportation planning through sharing of information and data. Regional ITS architecture uses the national standard, but is tailored to meet local needs.

Highway Advisory Radio

Highway Advisory Radio (HAR) provides traffic information to motorists along our highway system. Four low-power FM (LPFM) HAR sites in Iowa have been licensed and are operating: on I-80 at DeSoto and Adair; on the I-29 corridor at Sloan, and on I-380 near Urbana. Information supplied to travelers includes information that is available through the CARS/511 system as well as local incidents and alerts.

Due to FCC restrictions on available frequencies, use of LPFM is not feasible in metropolitan areas. In Des Moines, the Iowa DOT is using the new generation of AM radio (SuperHAR) technology to reach greater numbers of motorists with real-time traffic information relating to the reconstruction of I-235. AM SuperHAR uses the same CARS/511 voice recognition technology and programming utilized in automating the LPFM HAR deployments. SuperHAR deployments are planned for Iowa City and Quad Cities in 2007.

D. Primary Road Research

The Primary Road Research Fund expends \$750,000 annually on contracted research or project-specific research supplies or equipment. Primary Road Research projects in 2006 included the following.

Support for CTRE – Three shared research faculty positions are funded along with support for CTRE administration. For more information about CTRE and these positions, see Section IV of this report.

Development of an online library catalog – People no longer have to come to the library to search the card catalog. Anyone with internet access can scan the collection at www.dot.state.ia.us/research/lib_help.htm. This is helpful to DOT staff across the state and to researchers and staff of other state DOTs. Regular upload assistance is provided by the State Library.

Purchase of PGA mobile laboratory equipment –

Development of the mobile lab was privately funded; however, Iowa DOT purchased several pieces of equipment that are being researched. Objectives for the mobile lab are as follows.

- Develop improved laboratory and field-testing technologies and procedures for verification testing.
- Test and field measure the properties of soils that relate to performance and use this
 knowledge to develop methods of quality control/quality assurance (QC/QA) for
 geotechnical applications.
- Provide field training opportunities to contractors and public agency personnel.

Driver Behavior at Expressway Intersections - Differences in Visual Scanning, Stress and Driving Performance – The goal of this project is to compare drivers of different age

groups (i.e., young, middle aged and older drivers) and to determine how eye glance behavior, driver performance, and stress levels may be influenced by characteristics of the driver on and off the expressways. By studying these factors, recommendations for roadway design, and sign placement can be made in the context of how different drivers behave at these expressway intersections. An

instrumented vehicle available at the University of Iowa, Human Factors and Statistical Modeling Laboratory will be used for this project. It will encompass equal samples of older, middle-aged, and younger drivers traversing the same road configuration.

Development of ITS Operations Manual – Iowa ITS architecture includes several components, including CARS/511, Road Weather Information System (RWIS), and DMS. The procedures for operating these components need to be determined along with proper chains of command for implementing them. Some information currently exists in Iowa DOT publications, but there are gaps. This project entails developing an Iowa ITS

Operations Manual that organizes all procedures and protocol required to operate the ITS network in Iowa.

Testing & Long Term Monitoring of 9th St Bridge over I-235 in Des Moines - The 9th Street bridge in Des Moines is the first bridge in Iowa to use a unique integral abutment design. The integral abutments are supported on steel H-piles that are embedded into concrete drilled shafts seated in glacial clay. The design was developed in an effort to address environmental concerns regarding vibrations from pile driving while providing a long-lasting structure in the form of a jointless bridge. Although the innovation is promising it is new and will not become a common option without adequate testing and monitoring to validate design and behavior assumptions. A total of three pile/shaft elements will be instrumented and monitored over a minimum two-year period.

Field Testing of High Mast Lighting Towers - The Iowa DOT owns 233 high-mast lighting towers ranging from 100' to 180' tall. In 2003, a 140' tower collapsed due to a fracture at the welded connection at the baseplate. Subsequently, cracks were found in twenty other towers. In addition to the cracks at the base plate, a crack was also found at the welded access opening detail on one tower. The cracked towers were removed from service. An investigation was made of the collapse/cracking in the towers. The investigation found that the cause of the cracking was fatigue due to wind-induced vibrations. This research at Purdue University involves full-scale laboratory fatigue testing to determine the fatigue life of a bolted, reinforcing jacket that can be used to retrofit high-mast lighting towers.

E. Other Bureau Activities

1. Research Quarterly Reporting

An electronic quarterly progress reporting system was implemented for research projects beginning in FY 06. R&T Bureau staff have worked to enhance the system and to develop a reporting process based on data gathered. *Attachment 6* shows the report format.

2. Research Implementation

New research projects are required to include a technology transfer and implementation plan. During 2006, R&T Bureau staff began evaluating and tracking implementation in a more formalized process. A form was developed (modifying an existing Wisconsin DOT form) for the Technical Advisory Committees to formally plan the implementation of projects. The forms, which will be included in the final report from each project, are expected to be put in use during the coming year.

IHRB staff has begun reporting quarterly to the board on the implementation details for a select group of projects from the previous year, since it takes about a year to demonstrate implementation. The following projects were reviewed at the October, 2006 meeting

• TR-427, "Evaluation of High Slump Concrete for Bridge Deck Overlays," Several of these types of bridge decks have been installed in Buchannan County and several more

overlays are planned. Iowa DOT has used this method for 3 years on a dozen projects and it has been very popular.

- TR-473, "Rehabilitation of Concrete Pavements Utilizing Rubblization & Crack & Seat Methods," There is software associated with this project that is of great assistance to counties because it gives the structural estimates needed for design. Iowa DOT has standardized use of the multi-head type breaker. (This project is explained on Page 25 of *Attachment 10*)
- TR-527, "Guidelines for Removal of Traffic Control Devices in Rural Areas," County engineers received information about these guidelines, discussed them with their supervisory boards and put policies in place, but none had looked seriously into removing any stop signs based on the guidelines. However, many said that when dealing with the public this report was a tool to explain why there was or was not a sign at the intersection in question. (This project is explained on Page 31 of *Attachment 10*)

II. Other Research, Development and Technology Transfer Activities

Additional research, development, and technology transfer activities are carried out in several other Divisions and offices of the Department. *Attachment 7* shows the distribution of research funds throughout the Department.

A. Traffic & Safety Research

The Office of Traffic & Safety sponsors a number of highway safety related research and demonstrations projects each year. Although some are funded by IHRB or the SPR program, the primary funding source is the Iowa Traffic Safety Improvement Program (TSIP), which provides about \$500,000 annually. TSIP projects can be safety studies, research or public information initiatives. The Traffic Safety Fund, which funds the TSIP, is

½% of annual Iowa gas tax receipts. Proposals for TSIP projects are due August 15 each year. The FY 06 awarded projects are listed in *Attachment 8*.

The Safety Management System (SMS) is a diverse partnership of Iowa highway safety practitioners in engineering, enforcement, education, and emergency services dedicated to reducing the number and severity of crashes on Iowa's roadways. The group is facilitated by the Iowa DOT State Safety Engineer and has developed an extensive Safety Toolbox for use by Iowans interested in improving roadway safety. The group also funds small safety projects that provide high-impact safety messages or programs on a variety of topics

such as funding a pilot project for school bus cameras to record illegal passing of buses and partial funding for an older driver forum. Applications are taken twice annually for SMS projects.

Additional funds (\$160,000) for safety research and technology deployment were received in 2006 from Section 163 (.08 Blood Alcohol Content (BAC) incentive) grants. These funds will be used under a single 3 year project, Development and Implementation of Iowa's Comprehensive Highway Safety Plan (CHSP). CHSP is a data-driven plan developed under the leadership of the Office of Traffic and Safety in cooperation with the Iowa Governor's Traffic Safety Bureau (GTSB) and other partners within the Iowa SMS Coordination Committee. It uses historical crash data and other information to identify

highway safety problems and systematically and proactively address those problems. CHSP uses an integrated approach to highway safety, bringing to bear the diverse collective knowledge and practices of stakeholders involved in aspects of transportation planning, health care and injury prevention, law enforcement, driver training, traffic operations, social environments, road maintenance, vehicle design, road design, emergency response systems, human factors, and vehicle insurance.

B. Maintenance Research

The Office of Maintenance conducts a variety of research projects, mostly around the topic of winter road management. The following testing and evaluation projects were conducted in the winter. These are internal efforts, managed and conducted by Department field maintenance personnel, generally without additional funding.

Air Brakes on Anti Ice Trailers – One trailer was equipped with the standard electric brake system now used on all anti-ice trailers. The other trailer was equipped with an air brake system purchased from a local vendor. Both trailers were pulled throughout the winter season and then disassembled for comparison of how much corrosion had attacked the components. Material spread and liquid used was recorded during the electric brake test period. The

purpose was to determine if air brakes would require less maintenance during a winter season then the electric brakes we are currently using on our anti-ice trailers.

The air brakes required less maintenance and worked the entire winter season without major repair. The electric brakes however required disassembly and cleaning several times throughout the same period.

Flow Boy Semi Trailer – A semi flow boy trailer was constructed and tested at the Anamosa Maintenance garage to determine if its ability to haul more material then the

departments' typical tandem trucks will allow longer snowplow runs and produce other benefits in winter operations. Capacity for this trailer is approximately 3,400 gallons of liquid material (1,900 gallons in 2005) and approximately 12 ton of dry material (15 tons in 2005). This is an increase of hauling capacity of liquid due to expanding the tank.

The semi tractor was equipped with a plow and wing with the expectation that it will be able to treat nearly

96 lanes miles at 250 pounds per lane mile while plowing the roadway at the same time. The unit was also equipped to pre-wet and anti-ice using the patented O-Nozzle system.

I.C.E. Blades – I.C.E. (Isolated Carbide Edge) Snowplow Blades were tested to see if installing the carbide in a cylinder form and isolating them from one another will keep the carbide from fracturing and falling out. Several locations around the state were chosen to test the blades on actual snow plow runs and a test was conducted in District 4 to determine if the blades last longer under an accelerated wear test.

The test was conducted on dry bare pavement to determine if I.C.E. blades will wear longer then the standard blades we now use.

After comparing all four sets of blades it was concluded that the I.C.E. blade was not a better blade for this application. The I.C.E. blades are approximately 10% higher cost, due to the manufacturing process of drilling the holes to insert the carbide pieces.

Roll Tarps – Un-tarped loads of salt are exposed to moisture during snow runs which may cause it to freeze in the box. The salt then has to be dumped from the truck and a fresh load

taken from the salt shed. This frozen load has to be broken up and returned to the salt shed, thereby adding additional moisture to the dry salt in the shed. This additional moisture causes chunks to develop inside the salt shed which have to be broken up before use. The use of tarps may help protect loads from becoming wet and freezing in the truck box. This project was designed to test the ability of commercial tarps to protect salt loads,

their ease of use and to determine which tarp characteristics would provide the best protection against moisture.

It is the recommendation of the Winter Equipment Committee to provide a specification with the following features to be included in a truck tarp system.

- Wind Deflector on the front of the tarp where it rolls up on the cab protector.
- Side flaps on the tarp to completely cover the dump box and not allow snow to enter.
- Larger area or spool to allow the tarp to roll up even if the side flaps don't store well
- Driven by an electric motor.
- Automatic roll and unroll design.

Slush Blade - This project was designed to test the feasibility of mounting a rubber blade behind the carbide plow blade to clear slush, snow and water left by the carbide blade. The blade will be mounted in such a way that it could be retracted or lifted when not needed. Slush-blades with rubber elements are used for efficient removal of very wet snow, slush and ice/sleet.

The concept has proven to be very useful. It has been determined that further research and testing is needed. Cameras will be added to the plow next season to determine if the slush blade is actually taking the remaining ice/snow being left by the front blade.

Wedge Shaped Brine Tanks - Many locations are now using a 900 gallon upright tank mounted in the front of the dump box. This was not the safest way to carry the brine, so Maintenance personnel set out to design a set of tanks to mount on the sides of the box and still provide enough dry material to make a snow run.

The new tank design would be a single tank model, for each side and possibly eliminate the plumbing problems experienced in previous multiple tank setups. Cleaning of the dump box was also an issue; because the multiple tank setups had a stainless steel skid mounted to each tank (6 or 8 tanks) and made it difficult to clean out the salt that had collected underneath the tanks. However, the new design would not have any metal base and would be all plastic construction.

The new brine tanks seem to be performing well. Many positive reports were received back after a short period of testing the tanks. This design is expected to be put into statewide use.

C. Bridges & Structures Research

Innovative Bridge Research and Deployment - As part of TEA-21, FHWA implemented a program for bridge research and innovation titled Innovative Bridge Research and Deployment (IBRD), formerly known as Innovative Bridge Research and Construction (IBRC). The program was created in an effort to promote the use of new innovative materials and techniques in bridge design and construction.

In 2005, Iowa received funding for two IBRC projects using accelerated construction to be completed in FY 06. The total award was \$835,000. The Office of Bridges & Structures which has responsibility for coordinating and managing this program developed design plans and contract documents for these two projects and assisted Boone and Madison counties with construction inspection of critical components.

The two projects are: Boone County Bridge carrying a local road over Squaw Creek –

The existing structure was a one-lane reinforced concrete single span arch constructed in 1917. The bridge spans 76 ft and has a roadway width of 17.1 ft. The replacement structure is a prestressed concrete, three-span bridge (total length of 151' and width of 30').

The innovative aspect of this project is the use of precast reinforced concrete pier caps and abutment footings, and post-tensioned precast concrete deck panels (using high performance concrete) which will significantly reduce construction time. The use of precast components reduced construction time significantly. Total project cost: \$550,000

Madison County Bridge carrying a local road over a drainage ditch — The existing structure was a 21' wide steel girder bridge with a timber deck. The replacement structure is a single span, prestressed concrete box girder bridge.

The innovative aspect of this project is minimizing construction time by using high performance precast concrete components in the form of precast box girders for the superstructure and precast abutment footings for the substructure. In addition to the benefits of fast substructure erection, the use of shallow girder sections will result in a reduced profile thus eliminating the need for additional right-of-way and minimizing dirt work. The overall construction time may be reduced by 50%.

Total project cost: \$555,000

Shared Faculty Research Projects

The Bridge Engineer (BE) program associated with the Center for Transportation Research and Education (CTRE) at Iowa State University (ISU) provides bridge engineering support and research expertise. This includes support of the Office of Bridges and Structures in the development and conduct of research, support of special projects and support in training. Current research projects conducted by the BE program include the following.

Monitoring of Arch Hangers on I-235 Pedestrian Bridges - In the summer of 2003, the Iowa DOT constructed a 88m span, basket-handle arch pedestrian bridge over Interstate 235 near the Botanical Center in Des Moines, Iowa. The precast, post-tensioned concrete deck system used on this bridge represents perhaps the first application of precast, segmental construction on the Iowa highway system. The concrete deck panels on this bridge are suspended from the steel arch ribs using 1.5 inch diameter high strength steel rods.

The precast concrete deck panels were fabricated using a match-casting system in which the first panel was used as the end form during the casting of the second, or adjacent,

panel. The second panel was then used as the end form for the third panel, etc. This process was repeated until the all panels for the bridge had been cast. During this process, the final shape of the deck profile was precisely replicated by providing a very slight angle change at the joint between adjacent concrete panels. In order to avoid placing undue stress on the concrete panels, they must then be supported at this <u>exact</u> same relative elevation when erected and post-tensioned together in the field.

The support elevations of the concrete panels can be controlled by the precise adjustment of the anchor nut located at the bottom of the hanger rod directly beneath the panel (see Figure 1). During the construction of this bridge, it became evident that, in some cases, the hanger rod anchorage elevation, and therefore the tensile load in that particular hanger, varied considerably from that anticipated by the designers. Some minor cracking of the concrete panels was observed at the panel locations near these more-heavily loaded hanger rods.

In order to eliminate this disparity, the contractor performed a series of small adjustments in the final elevation of the panels during additional overnight closures of the highway below (see Figure 2). These overnight closures of the highway required considerable expense to the State for installation of traffic control and law enforcement as well as inconvenience and potential danger to both the traveling public and the onsite workers.

The Iowa State University Bridge Engineering Center was contracted to monitor and evaluate the structural performance of the hanger rods on two similar pedestrian bridges which were constructed near 40th and 44th Streets in Des Moines.

Investigation of Load Transfer Behavior of a Drilled Shaft at I-235 over UPRR in Des Moines - On September 26, 2005, a research team from the Iowa State University Bridge Engineering Center performed a load test to document the behavior of a single drilled shaft foundation of the eastbound I-235 bridge over the Union Pacific Railroad. The test was performed on a closed roadway, using two loaded tandem dump trucks positioned directly above the shaft in question. This test was performed with the trucks in a static position and no attempt was made to collect data under moving load conditions.

Testing and Evaluation of the US 63 Bridge in Davis County - The US 63 bridge in Davis County just north of Bloomfield was tested using DOT's snooper truck which was driven from North to South at a crawl speed (2-5 mph). Testing consisted of driving the snooper truck along three different paths to capture the overall behavior of the bridge.

Laboratory, Field Testing and Evaluation of Precast Bridge Elements - Demonstrating the benefits of precast, post-tensioned bridge components through this project may provide an opportunity for the Iowa DOT and Iowa county engineers to design and construct more cost effective and durable bridges. The research team will design and install monitoring systems and perform laboratory structural tests on bridge specimens that represent structural details for use on three field demonstration projects in Black Hawk County, Boone County, and Madison County. Evaluation of performance will be formulated

through comparisons with design assumptions, recognized codes, and standards including the AASHTO specifications.

Ultra High Performance Concrete using Pi Girder - Buchanan County will construct a bridge made of ultra high performance concrete Pi girders. The intent of the project is to assess the behavior of the individual elements during construction, their long-term performance, and the long-term performance and overall behavior of the completed bridge. This project directly addresses the FHWA's Innovative Bridge Research and Construction program's goal of demonstrating and documenting the effectiveness of innovative materials and construction techniques for new bridge structures.

Other Bridge Research

Determination of Condition of Steel Abutment Piles – A consultant was retained by Iowa DOT to investigate concerns about corrosion of abutment steel piles due to water leakage. Twelve existing bridges were examined and the condition of abutment piling was documented along other relevant soil data to understand the cause for corrosion. In addition to field measurement, laboratory analysis of the surrounding soil was conducted.

Investigation of Remaining Fatigue Life, I-80 over Missouri River in Council Bluffs - In order to determine whether to replace the deck or the superstructure of the existing I-80 bridge, WJE was contracted to perform a remaining fatigue life investigation. Based on the results of this investigation a superstructure retrofit option was selected to enhance the fatigue life.

D. Living Roadway Trust Fund Research

The Iowa Living Roadway Trust Fund (LRTF) is administered by the Office of Road Design. Recognizing the value of native plants in our roadsides, the Iowa Legislature established the LRTF program in 1988. Appropriations for the LRTF are allocated from the road use tax fund,

the Resource Enhancement and Protection (REAP) fund, and other sources. This annual competitive grant program provides funding for integrated roadside vegetation management (IRVM) activities, including the preservation, establishment, and maintenance of native vegetation along Iowa's roadsides. Since 1990, more than \$10 million has been awarded for research and demonstration projects, education and training programs, gateway landscaping, and roadside enhancement, maintenance, and inventories. Information about the program can be found at www.iowalivingroadway.com.

LRTF projects directly benefit Iowans in many ways, including the beautification of roadsides, the enhancement of children's education through the establishment of outdoor classrooms, and the improvement of water and air quality through the use of plant communities best adapted to, and sustainable along, our living roadways.

The LRTF encourages the submission of proposals for research addressing aspects of integrated roadside vegetation management. A request for research proposals is announced each spring. Deadline for submission of proposals is July 31. LRTF projects accepted for funding in 2006 are listed in *Attachment 9*.

III. Transportation Research Board

The mission of the Transportation Research Board is to promote innovation and progress in transportation through research. TRB is one of six major divisions of the National Research Council, a private institution administered by the National Academy of Science and National Academy of Engineering.

TRB provides an extensive range of services, including

- Opportunities for information exchange on current transportation research and practice
- Management of cooperative research and other research programs
- Analyses of national transportation policy issues and guidance on federal and other search programs, and
- Publication and access to research information from around the world.

Information exchange opportunities are provided through the annual TRB meeting, field visits by technical staff, conferences and workshops, and

standing committees and task forces. There are over 200 committees composed of engineers, administrators, researchers and educators who identify research needs, review papers for presentation and publication, and encourage implementation of research findings.

TRB administers both the National Cooperative Highway Research Program (NCHRP) and the Strategic Highway Research Program (SHRP II). All state highway departments contribute annually to NCHRP research activities. Research priorities are set by AASHTO's Standing Committee on Research. Another program administered by TRB is Innovations Deserving Exploratory Analysis (IDEA) which encourages exploration of untested concepts with potential technological breakthroughs.

TRB committees with Iowa DOT participation:

- Committee on General Structures Sandra Larson, member
- Portland Cement Concrete Pavement Construction Sandra Larson, member
- Task Force on Surface Transportation Weather Sandra Larson and Tina Greenfield, members
- Committee for Pavement Technology Review and Evaluation Sandra Larson, member
- NCHRP Project Panel on IDEA Sandra Larson, member
- NCHRP Panel on Development of Guidelines to Improve Safety During Nighttime Construction or System Preservation Work Mark Bortle, Chair
- Transportation Safety Management
- Safety Data, Analysis and Evaluation Tom Welch, member
- Committee for a Study of Supply and Demand for Highway Safety Professionals in the Public Sector Tom Welch, member
- NCHRP Project Panel on Median Intersection Design for Rural High-Speed Divided Highways - Tom Welch, member

- NCHRP Project Panel on AASHTO Strategic Highway Safety Plan Implementation Support Tom Welch, member
- NCHRP Project Panel on Safety and Other Implications of Changed Speed Limits on High Speed Roads - Tom Welch, member
- SHRP II Technical Coordinating Committee for Safety Research Tom Welch, member
- NCHRP Project Panel on Balancing the Benefits and Tradeoffs of Shoulder Rumble Strips and Centerline Rumble Strips on Divided and Undivided Highways in Urban and Rural Areas - Troy Jerman, member
- NCHRP Project Panel on Evaluation of Safety Strategies at Signalized Intersections Troy Jerman, chair
- Properties of Concrete Bob Younie, member
- Mineral Aggregates Bob Younie, member
- NCHRP Project Panel on Testing and Calibration Methods for RWIS Sensors Dennis Burkheimer, chair
- Characteristics of Nonbituminous Components of Bituminous Paving Mixtures Jon Hinrichsen, member
- SHRP II Expert Task Group on Collaborative Decision Making on Additions to Highway Capacity Steve Larson, member
- Effect of Median Width and Slope on the Frequency and Severity of Cross-Median Accidents on Rural Roadways Dave Little, member
- NCHRP Project Panel on Improvement of Procedures for the Safety-Performance Evaluation of Roadside Features Dave Little, member
- NCHRP Project Panel on Criteria for Restoration of Longitudinal Barriers Dave Little, member
- NCHRP Project Panel on Cost Effective Measures and Planning Procedures for Travel Time Variation, Delay, and Reliability Phil Mescher, member
- NCHRP Project Panel on Thermally Sprayed Metallic Coatings to Protect Steel Pilings Joe Putherickal, member
- NCHRP Project Panel on Alternative Organizational Designs for State Transportation Departments for Improving Strategy, Delivery, and Operations – Nancy Richardson, chair
- Roadside Maintenance Operations Joy Williams, chair
- NCHRP Project Panel to Develop AASHTO Guidelines for Vegetation Control Joy Williams, member
- Signing and Marking Materials Kurtis Younkin, member

IV. University Research Coordination

A. Iowa Transportation Research Collaboration Agreement

The Iowa DOT has a collaboration agreement with The University of Iowa, Iowa State University, the University of Northern Iowa, and CTRE. The purpose of the collaboration is to facilitate transportation research to benefit the state of Iowa.

Semi-annual collaboration meetings are held to order priorities among groups, bring new ideas to the table, review needs, expertise, and facilities available. The group also collaborates on independent transportation research, looking for new ways to serve the state through regional and national research interests. Meeting sites rotate among member agencies, enabling participants to get to know each other's capabilities.

Many research projects come about as a result of focus groups comprised of DOT staff, city and county engineers, consultants, industry and university representatives. Focus groups are initiated by the DOT, based on types of work as

outlined in the Iowa Transportation Research Collaboration Agreement. The Road Weather Issues focus group meeting in June 2004 was the first of its kind in the Midwest. The Human Factors focus group meeting held in June 2005 was also the first of its kind for the region. Other focus group topics include pavement, construction, hydraulics, drainage, environment, geotechnical issues, and planning.

A page for information about the collaboration is included in the R&T Bureau's web pages (http://www.dot.state.ia.us/research/collaboration.htm). Researchers can visit the site to find the business plan, focus group information and a contact list developed to facilitate collaboration among researchers at different universities.

B. Center for Transportation Research & Education (CTRE)

The Center for Transportation Research and Education (CTRE) coordinates transportation research activities for Iowa State University. CTRE's mission is to develop and implement innovative methods, materials, and technologies for improving transportation efficiency, safety, and reliability while improving the learning environment of students, faculty, and staff in transportation-related fields.

CTRE's work with the Iowa DOT is structured with a three-year rolling Basic Agreement and Management Agreement, Annual Work Plans and individual research project addenda.

CTRE supports the work of Iowa DOT through a variety of activities, including:

- Conducting research
- Administering the Local Technical Assistance Program (LTAP)
- Continued development of a technician training program
- Support for pavement management and geographic information systems (GIS) development
- Statewide Urban Design & Specifications program (SUDAS)
- Support for remote sensing activities as part of the GIS program
- Statewide traffic safety database system.
- Conducting the 2005 Mid-Continent Research Symposium
- Conducting training, technology transfer workshops and conferences
- Leading focus groups.

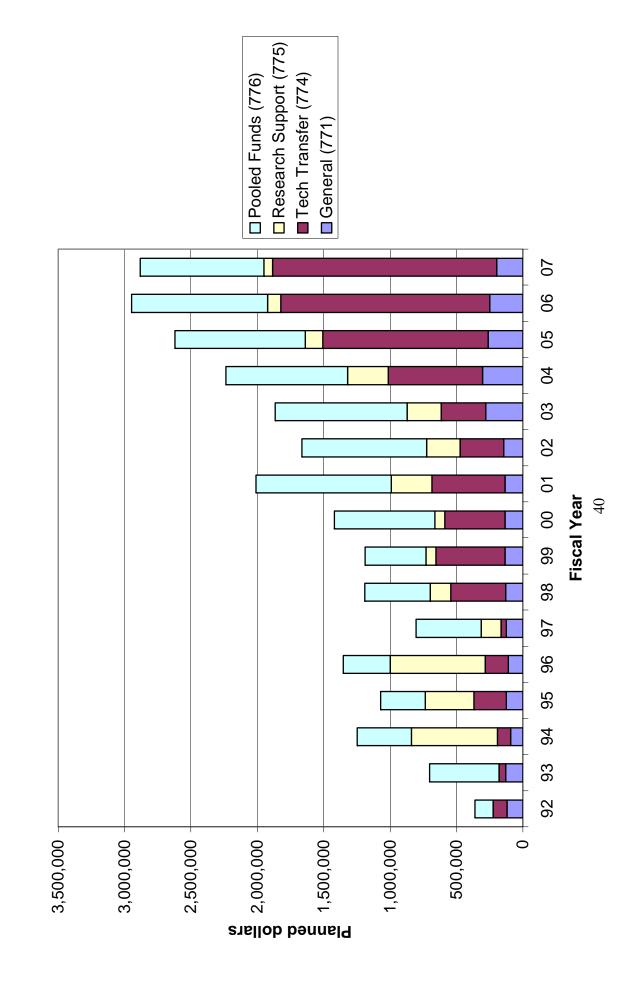

Each year the Iowa DOT and CTRE develop work plans for shared faculty in three major transportation research areas: structures, materials, and PCC pavements. These shared faculty provide the DOT with expertise in specialized technical areas. The bridge engineer conducts research projects and assists the Office of Bridges & Structures as needed. The materials engineer conducts research, provides training and assists with special investigations, particularly with regard to hot mix asphalt. The PCC engineers conduct research projects, develop and execute the research program for the CP Tech Center and help the Center develop and execute training and technology transfer programs. The CP Tech Center develops concrete research in its testing and teaching laboratory and administers several Iowa-led pooled fund projects.

CTRE also supports the Iowa DOT through administration of the DOT Library. The librarian selects, catalogs and retains materials for the library, conducts literature searches for researchers, posts research activities to the Transportation Research Information System (TRIS) and Research in Progress (RIP) databases and represents Iowa in the Midwest Transportation Knowledge Network (MTKN).

Other ongoing research includes traffic and safety, winter operations, remote sensing and long-term transportation planning. A total of about 100 individual research contracts are structured as Addenda to the Management Agreement.

Iowa Traffic Safety Data Services Center	\$25,000
Workzone Safety Research & Development	\$22,500
Traffic Sign Inventories / Replacement Program	\$20,000
Statewide / Work Zone Safety Education	\$50,000
Traffic Education for Safety Awareness Campaign	\$50,000
San Marnan Drive and Flammang Drive Traffic Safety Study	\$50,000
Safety Management System Toolbox Implementation	\$30,000
Before / After Analysis of Installation of Signals at High Speed Signalized Intersections	\$10,000
TOTALS	\$604,000

Research Projects Accepted for 2006 Living Roadway Trust Fund

Project	Amount
Native Cover Crops: Second Year Establishment of Native Species	28,244
Adding Wildflower Diversity to Species Poor Grasslands	23,976
Does the dominant warm-season grass determine the diversity of prairie reconstructions	9,000
Total	\$ 61,220

RESEARCH AND DEVELOPMENT

The Highway Division of the Iowa Department of Transportation engages in research and development for two reasons: first, to find workable solutions to the many problems that require more than ordinary, routine investigation; second, to identify and implement improved engineering and management practices.

This report, entitled "Iowa Highway Research Board Research and Development Activities FY2006" is submitted in compliance with Sections 310.36 and 312.3A, Code of Iowa, which direct the submission of a report of the Secondary Road Research Fund and the Street Research Fund respectively. It is a report of the status of research and development projects, which were in progress on June 30, 2006; it is also a report on projects completed during the fiscal year beginning July 1, 2005, and ending June 30, 2006. Detailed information on each of the research and development projects mentioned in this report is available in the Research and Technology Bureau in the Highway Division of the Iowa Department of Transportation.

IOWA HIGHWAY RESEARCH BOARD

In developing a progressive, continuing and coordinated program of research and development, the Highway Division is assisted by the Iowa Highway Research Board. This advisory group was established in 1949 by the Iowa State Highway Commission to respond to the research denoted in Section 310.36 of the Code of Iowa and now is denoted by 312.3A.

The Research Board consists of 15 regular members: seven Iowa county engineers, four Iowa DOT engineers, one representative from Iowa State University, one from The University of Iowa, and two engineers employed by Iowa municipalities. Each regular member may have an alternate who will serve at the request of the regular member. The regular members and their alternates are appointed for a three-year term. The membership of the Research Board as of June 30, 2006, is listed in Table I.

The Research Board held seven regular meetings during the period of July 1, 2005, to June 30, 2006. Suggestions for research and development were reviewed at these meetings and recommendations were made by the Board.

TABLE I

2005-2006 IOWA HIGHWAY RESEARCH BOARD MEMBERS

Member Ahmad Abu-Hawash Chief Structural Engineer Iowa DOT Bridges and Structures 800 Lincoln Way Ames, IA 50010 (515) 239-1393	Term Expires 12-31-06	Alternate Deanna Maifield Methods Engineer Iowa DOT Office of Design 800 Lincoln Way Ames, IA 50010 (515) 239-1402
John Adam Deputy Director Iowa DOT - Statewide Operations Bureau 800 Lincoln Way Ames, IA 50010 (515) 239-1333	12-31-08	James Berger Director of Materials Iowa DOT 800 Lincoln Way Ames, IA 50010 (515) 239-1843
James Alleman Dept. of CCE Engineering Iowa State University 390 Town Engineering Bldg. Ames, IA 50011 (515) 294-3532	-	
Lyle Brehm Tama County Engineer 1002 W. 5 th Street Tama, IA 52339-2216 (614) 484-3341	12-31-02	Wade Weiss Green County Engineer 114 N. Chestnut Jefferson, IA 50129 (515) 386-3316
Scott Dockstader District Engineer Iowa DOT - District 1 1020 S. Fourth Street Ames, IA 50010 (515) 239-1194	12-31-07	Robert Younie Construction Engineer Iowa DOT - District 1 1020 S. Fourth Street Ames, IA 50010 (515) 239-1542
Robert Ettema Dept. of Civil & Env. Engineering The University of Iowa 4105 Seamans Center Iowa City, IA 52242 (319) 384-0596	-	_
Todd Fonkert Bremer County Engineer 1995 Euclid Avenue Waverly, IA 50677 (319) 352-4302 SS# 009	12-31-07 District 2	Danny Waid Howard County Engineer 137 N. Elm Street Cresco, IA 52136 (563) 547-2620 SS# 045

Jon Ites Buena Vista County Engineer 215 E. 5 th Street P.O. Box 368 Storm Lake, IA 50588 (712) 749-2540 SS# 011	12-31-06 District 3	Steve Camp Pocahontas County Engineer 99 Court Square, Suite 4 Pocahontas, IA 50574-1629 (712) 335-3252 SS #076
Larry Jesse Director of Local Systems Iowa DOT 800 Lincoln Way Ames, IA 50010 (515) 239-1291	12-31-06	Mark Kerper Assistant Director Office of Location and Environment Iowa DOT 800 Lincoln Way Ames, IA 50010 (515) 239-1591
John Joiner Public Works Director 515 Clark Avenue P.O. Box 811 Ames, IA 50010 (515) 239-5165	12-31-08	Ronald Knoche City Engineer 410 E. Washington Street Iowa City, IA 52240-1825 (319) 356-5138
Jeff Krist Project Manager Public Works Department 209 Pearl Street Council Bluffs, IA 51503 (712) 328-4635	12-31-06	Richard Fosse Director of Public Works 410 E. Washington Street Iowa City, IA 52240-1825 (319) 356-5141
Mark Nahra Delaware County Engineer 2139 Highway 38 P.O. Box 68 Delaware, IA 52036 (563) 927-3505 SS# 028	-	-
John Rasmussen Pottawattamie County Engineer 223 South 6 th Street Council Bluffs, IA 51501 (712) 328-5608 SS# 078	12-31-08 District 4	Jim Ebmeier Mills County Engineer 403 Railroad Avenue Glenwood, IA 51534 (712) 527-4873 SS# 078
Roger Schletzbaum Marion County Engineer 402 Willetts Drive Knoxville, IA 50138 (641) 828-2225 SS# 063	12-31-07 District 5	Jim Armstrong Appanoose County Engineer 1200 Highway 2 W Centerville, IA 52544 (641) 856-6193 SS# 004
Clark Schloz Jackson County Engineer 201 W. Platt Maquoketa, IA 52060 (563) 652-4782 SS# 049	12-31-06 District 6	Steve Gannon Linn County Engineer 1888 County Home Road Marion, IA 52302-9753 (319) 892-6400 SS# 057

RESEARCH AND DEVELOPMENT PROJECTS

Proposals for research and development are reviewed by the Iowa Highway Research Board, and its recommendations are transmitted to the Director of the Highway Division of the Department of Transportation. Expenditure of funds for research and development is then authorized on an individual project basis.

These expenditures may be charged to the Primary Road Fund, Farm-to-Market Road Fund or the Street Research Fund, depending on which road system will benefit from the project. If more than one jurisdiction's roads share in the benefits, the costs are shared.

Table II is a record of expenditures for research and development made during the fiscal year ending June 30, 2006. Total expenditure was \$3,109,442.42.

IN-HOUSE RESEARCH AND DEVELOPMENT

Research and development projects performed by Iowa DOT personnel are termed "in-house" projects. These projects may involve other departmental and field personnel, in addition to personnel from the Research and Technology Bureau, Operations Research Section. In many instances, personnel from other offices are designated as principal investigator, which means that they have a major role in the planning, performance and analysis of the research.

Contract research funds may be used for material and equipment costs for in-house research, but cannot be used for salary or personal expenses of the participating personnel. Consequently, the contract amounts for in-house projects are relatively small. The Research and Technology Bureau, Operations Research Section, wishes to express its appreciation to other offices for their assistance.

NATIONAL COOPERATIVE HIGHWAY RESEARCH PROGRAM

The National Cooperative Highway Research Program (NCHRP) was organized by the American Association of State Highway Officials (now the American Association of State Highway and Transportation Officials—AASHTO). The program is administered by the Transportation Research Board (TRB), a branch of the National Academy of Sciences.

The purpose of NCHRP is to provide the funds and direction for research in highway matters of national concern.

The program is funded annually by all of the states in an amount equal to 0.055 percent of the federal aid allocated to the states for highways. Iowa's obligation and actual expenditure for NCHRP varies and may be influenced by billing practices.

SECONDARY ROAD TRAFFIC COUNT PROGRAM

Secondary road traffic counts and road inventories are conducted annually and funded from the Secondary Road Research Fund as Non-contract Engineering Studies. The Office of Transportation Data conducted traffic counts in 25 counties during fiscal year 2006 as part of the Annual Traffic Count Program. This activity consisted of 5900 portable recorder classification counts, 170 portable recorder volume counts and 50 manual counts. Traffic volumes from these counts are used to develop Motor Vehicle Traffic Flow Maps for each county showing the Annual Average Daily Traffic (AADT) on specific road sections within each county.

Secondary roads geometrics and current condition inventories were requested from and were submitted by all 99 counties. This data provides county engineers, highway engineers, planners and administrators with essential information needed to determine design standards, to systematically classify highways, and to develop programs for improvement in maintenance of secondary roads.

SECONDARY ROAD RESEARCH FUND

Section 310.34 of the Iowa Code authorizes the Iowa Department of Transportation to set aside each year an amount not to exceed 1½ percent of the receipts to the Farm-to-Market Fund in a fund to be known as the Secondary Road Research Fund. This authorization was first made in 1949; it was repealed in 1963 and reinstated in 1965. When the fund was reinstated, the use was designated to finance engineering studies and research projects. The Iowa Department of Transportation accounting procedure for the Secondary Road Research Fund is based on obligations for expenditures on research projects and not the actual expenditures. The fiscal year 2006 financial summary is:

Beginning Balance 7-1-05		\$2,553,235.15
Receipts		
State Road Use Tax Fund		
$(1\frac{1}{2}\% \text{ of receipts})$	\$1,176,250.45	
Federal Aid Secondary		
$(1\frac{1}{2}\% \text{ of receipts})$	0.00	
Research Income	0.00	
Sub-Total		\$1,176,250.45
Total Funds Available		\$3,729,485.60
Obligation for Expenditures		
Obligated for		
Contract Research	\$1,862,750.87	
Non-Contract		
Engineering Studies	242,620.34	
Total Expenditures		\$2,105,371.21
BALANCE 6-30-06		\$1,624,114.39

STREET RESEARCH FUND

The Street Research Fund was established in 1989 under Section 312.3A of the Iowa Code. Each year \$200,000 is set aside from the street construction fund solely for the purpose of financing engineering studies and research projects, which have as their objective the more efficient use of funds and materials available for construction and maintenance of city streets. The Iowa Department of Transportation accounting procedure for the Street Research Fund is based on obligations for expenditures on research projects and not the actual expenditures. The fiscal year 2006 financial summary is:

Beginning Balance (7-1-05)	\$ 957
FY06 Street Research Funding	200,000
Total Funds Available for Street Research	\$200,957
Total obligated for Expenditure	\$183,854
Ending Unobligated Balance 6-30-06	\$17,103

PRIMARY ROAD RESEARCH FUND

The Primary Road Research Fund is from non-obligated funds of the Primary Road Fund. These funds can only be expended on Iowa DOT projects for which the funds were reserved, such as contracted research and project-specific research supplies or equipment. An estimate of Primary Road Research Fund expenditures is made prior to the beginning of each fiscal year. The amount expended for contract research from the Primary Road Research Fund for FY06 was \$751,387.35 and the estimate for FY07 is \$750,000.

PROJECTS INITIATED DURING FY 2006

TR-541	The Effects of Headcut and Knickpoint Propagation on Bridges in Iowa
TR-542	Development of Continuous Concrete Slab Bridge Standards
TR-543	Development of Three Span Prestressed Concrete Beam Bridge Standards
TR-544	Technology Transfer Toolbox: A Research Implementation How-To Guide
TR-545	Development of Self-Cleaning Box Culvert Designs
TR-546	Revision to the SUDAS Traffic Signal Design Guide
TR-547	Investigation of Electromagnetic Gauges for Determination of In-Place Density of HMA Pavements
TR-548	Investigation of the Impact of Rural Development on Secondary Road Systems
TR-549	Roadway Design Standards for rural and Suburban Subdivisions
TR-550	Performance Evaluation of Rubberized Pavements in Iowa
TR-551	Local Agency Pavement Marking Plan
TR-552	Field Evaluation of Timber Preservation Treatments in Iowa Highway Applications
TR-553	Examination of Curing Criteria for Cold In-Place Recycling
TR-554	Performance and Evaluation of Concrete Pavement Granular Subbase
TR-555	Evaluation of Hot-Mix Asphalt Moisture Sensitivity Using the Nottingham Test Equipment
TR-556	Feasibility Investigation of Segmentally Precast Bridge Piers for Accelerated Construction
TR-557	Evaluation of Lignin Derived from Agricultural Co-Products as an Antioxidant in Asphalt
TR-558	Use of Ultra-High Performance Concrete in Geotechnical and Substructure Applications
TR-559	Improved Method for Determining Wind Loads on Highway Sign and Traffic-Signal Structures
TR-560	Clear Zone - A Synthesis of Practice and Benefits of Meeting the Ten-Foot Clear Zone Goal on Urban Streets

20 Projects

PROJECTS COMPLETED DURING FY 2006

The following projects were completed during FY 2006 and the project final reports were approved by the Iowa Highway Research Board:

Project Number	Project Title	Completion Date
TR-412	Development of a Computer Controlled Underbody Plow	1/27/2006
TR-427	Evaluation of High-Slump Concrete for Bridge Deck Overlays	10/28/2005
TR-466	Evaluation of Unbonded Ultrathin Whitetopping of Brick Streets	6/30/2006
TR-473	Rehabilitation of Concrete Pavements Utilizing Rubblization and Crack and Seat Methods	9/30/2005
TR-483	Evaluation of Hot Mix Asphalt Moisture Sensitivity Using the Nottingham Asphalt Test	10/28/2006
TR-484	Materials and Mix Optimization Procedures for PCC Pavements	4/1/2006
TR-489	Innovative Solutions for Slope Stability Reinforcement and Characterization in Iowa Soils	1/27/2006
TR-503	Utility Cut Repair Techniques – Investigation of Improved Utility Cut Repair Techniques	2/24/2006
TR-511	Design and Construction Procedures for Concrete Overlay and Widening of Existing Pavements	10/28/2005
TR-514	Development of a Manual of Practice for Roadway Maintenance Workers	6/30/2006
TR-515	A Guide for Monitoring and Protecting Bridge Waterways Against Scour	4/1/2006
TR-521	Field & Laboratory Investigation of Hydraulic Structures Facilitating Fish Abundance & Passage Through Bridges in Iowa	2/24/2006
TR-524	Review of Inconsistencies Between SUDAS and Iowa DOT Specifications	6/30/2006
TR-526	Feasibility of Cooperative Development of Wetland Mitigation Projects	2/24/2006
TR-527	Guidelines for Removal of Traffic Control Devices in Rural Areas	12/8/2005
TR-532	Evaluation of Transverse Joint Forming Methods in PCC Pavement	2/24/2006
TR-535	Reuse of Lime Sludge from Water Softening and Coal Combustion Byproducts	9/30/2005
TR-537	Iowa Data Collection and Analysis for the 2005-2006 National Surface Characteristics	2/24/2006
TR-538	Using Scanning Lasers for Real-Time Pavement Thickness Measurement	6/30/2006
10 Projects		

19 Projects

Table II FINANCIAL SUMMARY OF RESEARCH AND DEVELOPMENT PROJECT EXPENDITURES July 1, 2005 to June 30, 2006 (Active projects with no current fiscal year expenditures are not included)

<u>Project</u>	<u>Project Title</u>	Primary Road Research Fund Expenditures	Secondary Road Research Fund Expenditures	Street Research Fund Expenditures	Total <u>Expenditures</u>
140	Collection and Analysis of Stream Flow Data	76,697.59	121,865.27	23,351.96	221,914.82
296	ISU Local Technical Assistance Program (LTAP) Evaluation of Unbonded Ultrathin Whitetopping of Brick	10,000.00	63,247.80	42,263.77	115,511.57
466	Streets			5,924.95	5,924.95

Collection and Analysis of Stream Flow Data

Objective: Collect the data necessary for analytical studies (including flood-frequency discharge estimation) to define, for any location, the statistical properties and trends in discharge or elevation of streams, lakes, and reservoirs. Define the water-surface-elevation profiles and corresponding discharges along streams in basins with at least 100 mi² of drainage area for selected floods. Evaluate the flood characteristics and hydraulics at existing and proposed flow structures in basins of all sizes when requested.

Progress: Data collection and annual reporting of stream flow data is ongoing annually.

Reports: Annual Report, Flood Event Reports

Implementation: Flood frequency and discharge data is used for sizing hydraulic structures across the state. Structure design agencies use this data for their designs.

Iowa State University Local Technical Assistance Program (LTAP)

Objective: The objective of this project is to help Iowa's local governments keep up with growing demands on local roads, streets, bridges, and public transportation. The center provides technical and management assistance to Iowa's local transportation officials through a variety of programs.

Progress: The major tasks are the following:

- publishing at least six *Technology News* newsletters per vear.
- conducting at least 10 training courses/workshops per year,
- distribute publications,
- provide service and information to users, and
- present transportation safety information to rural communities by employing a Transportation Safety Circuit Rider.

Reports: Newsletters

Implementation: Implementation of research findings and the proper training of state and county employees will improve the quality and reduce the cost of road construction and maintenance.

Transportation Research Board Education for County Engineers

Objective: The objective of the project is to send two county engineers annually to the TRB Annual Meeting in Washington, D.C., for research education. County engineers selected are generally those starting their term as regular members of the IHRB. The experience of attending the TRB Annual Meeting gives county engineers serving on the IHRB a better understanding of research at a national and international level. Additional benefits may be gained as the county engineers begin to develop ideas for research from their experience at the TRB meeting.

Progress: In the time period 1995 to 2006, a total of 19 county engineers were sent to TRB.

Reports: None

Implementation: All county engineers who have attended the conference so far thought it was a very good educational experience. They believe the experience will allow them to better serve their counties and the IHRB.

Effective Structural Concrete Repair

Objective: The overall objective will be to develop innovative repair methods/materials that result in cost effective repair of structural concrete elements.

Progress: A final report summarizing the work to date was presented at the April 2004 meeting. Also, a synopsis of the installation procedures used for each of the FRP wraps has been created for use by maintenance personnel. The synopsis is included as an appendix to the final report. A revised final report will be prepared in 2008 to reflect the service life of the documented repairs.

Reports: Final Report, April 2004

Implementation: Results from this investigation will provide technical information that engineers in the bridge field can use to lengthen the useful life of structural concrete bridges.

An Integral Abutment Bridge with Precast Concrete Piles

Objective: The research objectives are the following:

- Determine the state departments of transportation that permit the use of PCC piles in integral-abutment bridges. For those states that use PCC piles in this type of a bridge, summarize the PCC pile design practices and investigate the abutment to pile connection details.
- Evaluate the performance of selected PCC piles in the bridge on County Route E43 over Otter Creek in Otter Creek Township of Tama County. This bridge will be referred to as the Tama County Bridge.
- Establish the longitudinal displacement versus temperature behavior for the abutments of the Tama County Bridge.

Progress: Final analysis and report preparation are underway. A final report is expected in early 2007.

Reports: None

Implementation: The results obtained from this research will provide bridge design engineers with a better understanding of the behavior of the PCC abutment piles in the Tama County integral-abutment bridge. Engineers with the Office of Bridges and Structures of the Iowa Department of Transportation have expressed concerns regarding the ductility of PCC piles in an integral-abutment bridge, since PCC piles exhibit non-ductile behavior. The experimental measurements of the lateral-displacement of the abutment pile caps, periodic visual inspections of the top portion of selected PCC abutment piles, and recorded longitudinal strains for these selected PCC piles in the Tama County Bridge will provide bridge design engineers with information regarding the performance characteristics of these PCC piles.

Agency:

Purdue University and sub-contract with Iowa State University

Principal Investigator:

Rebecca S. McDaniel (Purdue University) and Brian Coree (Iowa State University)

Research Period:

June 1, 2001 to June 30, 2007

Research Board Funding:

\$80,000 (Purdue University - \$23,674; Iowa State University - \$56,326)

Funding Source:

Pooled funds coordinated by North Central Superpave Center at Purdue University - 50% Institute for Safe, Quiet, and Durable Highways funds, 25% Indiana DOT funds and 25% State -100% Primary funds

Identification of Laboratory Techniques to Optimize Superpave HMA Surface Friction Characteristics

Objective: The main purpose of this research is to evaluate various blends of aggregates to optimize the combination of micro- and macro-texture to achieve a desired level of friction. Aggregate classifications and properties currently used to provide desirable friction levels for high traffic situations will be evaluated and possibly revised based upon this research.

Progress: Issues have created challenges with this project, such as identifying aggregates that would be of interest to the two sponsors of the project, the Indiana and Iowa Departments of Transportation. These issues have now been resolved, and work can be accelerated on this project. A final report is expected in early 2007.

Reports: None

Implementation: These research findings are expected to identify blends of aggregates that can be used in Iowa to maintain the current baseline of friction. It is anticipated that increase macrotexture will diminish the need for high quality friction aggregates to provide increased microtexture. This will lead to more economical surface courses for use in Iowa by reducing the need to import friction aggregates.

Agency:

Principal Investigator:

Wilfrid A. Nixon

Research Period:

May 1, 2001 to April 30, 2005

Research Board Funding:

\$151,920

Funding Source:

100% State -30% Primary funds, 60% Secondary funds and 10% Street funds

Field Testing of Abrasive Delivery Systems in Winter Maintenance

Objective: The objective of this project is to conduct a series of experiments aimed at improving the ability of abrasives to increase friction on snow and ice-covered roads. Two novel delivery methods will be tested and compared with existing delivery methods, using a friction measuring device. It is expected that friction increases due to abrasives will diminish more slowly with the two delivery methods than with existing delivery methods.

Progress: Delays resulting from obtaining appropriate winter conditions for testing as well as administrative delays have slowed progress on this project. It is anticipated that a final report will be prepared in 2007.

Reports: None

Implementation: Maintaining roads in winter in Iowa is difficult. The safety of the driving public is paramount. If one of these novel abrasive delivery methods proves more effective than conventional methods and is-cost effective, then winter maintenance will be more easily performed and the driving public will be safer.

12 rows of corn provide the best alternative to the traditional snow fence in terms of performance and cost effectiveness.

Living Snow Fences

Objective: The following are the main objectives:

- Determine the optimal configuration of corn rows and switch grass to "catch" drifting snow. Other living snow fences may also be studied during this part of the study, and direct comparison with artificial (i.e. wooden or plastic) snow fences will be made.
- Create a living snow fence design guide which parallels the snow fence guide developed under SHRP. This will indicate how to configure living snow fences for given levels of snow fall and wind fetch.
- Develop suitable marketing tools to "sell" living snow fences as a desirable option to landowners. This will include attempting to develop an appropriate cost tool to be used in providing compensation to landowners.

Progress: A draft final report has been submitted and should be presented to the Iowa Highway Research Board in January 2007.

Reports: Draft Final Report, September 2006

Implementation: The results of this study will be presented at an appropriate meeting in Iowa after completion of the project. The report and the design guide will also be made available via e-mail to all subscribers to the snow and ice mailing list, and would be placed on the Snow and Ice Cooperative Program and Iowa DOT Web sites.

Field Performance Study of Past Iowa Pavement Research: A Look Back

Objective: The objective of this project is to take a comprehensive look back at selected Iowa Highway Research Board projects to evaluate their performance over a period that is more representative of their expected service life.

Progress: A draft final report has been submitted and should be presented to the Iowa Highway Research Board in January 2007.

Reports: Draft Final Report

Implementation: The results of this study will also provide a better understanding of pavement performance and the factors that influence performance. Validated findings of the past pavement research is being summarized. The new findings will provide a measure of the impact that the pavement research program has made on pavement design, construction and material selection.

Rehabilitation of Concrete Pavements Utilizing Rubblization and Crack and Seat Methods

Objective: The objective of this project is to study the effects of PCC rubblization and crack-and-seat operations of the HMA overlay thickness necessary to achieve the desired design life. To design HMA overlay on fractured slabs, it is necessary for the design to specifically avoid, or control, the primary distress, i.e. reflective cracking. This is the function of the slab fracturing process in combination with a sufficient thickness of HMA overlay to control the strains at the bottom of the HMA layer, which are a function of the constitution of the entire pavement structure, more especially the subgrade. In order to achieve this objective, four sub-objectives will need to be addressed: 1) to determine the structural value of PCC slabs fractured by either method, 2) to examine design, construction and performance records of existing overlaid fractured PCC pavements to estimate the effects of subgrade, fractured slab thickness and structural value, and overlay thickness on performance (or life), 3) to establish a structural and fatigue model, and 4) to validate/calibrate the model using in-service pavement performance histories and the instrumented pavements on IA 141. Ultimately, this project will provide a research report and design guidelines to the Iowa DOT.

Reports: Final Report, September 2005

Implementation: The structural value of the fractured slabs will provide more accurate information for the design of overlays over rubblized and crack and seat pavements. The design guide may be used by pavement designers for improvement of the pavement designs.

Agency:

The University of Iowa

Principal Investigator:

Hosin "David" Lee

Research Period:

May 1, 2002 to June 30, 2007

Research Board Funding:

\$270,513

Funding Source:

100% State -60% Primary funds, 35% Secondary funds and 5% Street funds

Development of a Mix Design Process for Cold In-Place Rehabilitation Using Foamed Asphalt- Phases I and II

Objective: The main objective is to develop a new mix design process for CIPR using foamed asphalt. The research will 1) review past research efforts on foamed asphalt, 2) evaluate the current practices of CIPR with emulsion, 3) determine mix design parameters for CIPR with foamed asphalt, and 4) develop a lab procedure.

Progress: All necessary RAP materials were collected from seven different sources. The developed foamed asphalt mix design process was successfully validated against seven different RAP materials. The SPT equipment from Interlaken was successfully installed and calibrated at the Asphalt laboratory of the University of Iowa. A time extension was needed because the Interlaken SPT equipment needed extra time in calibration and the Wirtgen foaming equipment broke down and it had to be shipped to Wirtgen in Tennessee for repair. Both the Interlaken SPT equipment and the Wirtgen foaming equipment are now operational. The Dynamic modulus test and flow number test are scheduled to be completed by the end of March, 2007, and the additional three months are needed to analyze the data and write a final report.

Reports: None

Implementation: The implementation outlook for the proposed project is very realistic, given a number of planned construction projects of CIPR pavements using foamed asphalt in Iowa. The results of this study will provide a better understanding of the CIPR process using foamed asphalt. A new design method for the CIPR using foamed asphalt is expected to come out of the study for implementation.

Investigation of the Long Term Effects of Concentrated Salt Solutions on Portland Cement Concrete

Objective: The objectives of this project are:

- Determine the long-term effects of concentrated solutions of magnesium, sodium and calcium chloride as well as calcium magnesium acetate or other alternative liquid deicers on durable Portland cement concrete
- Estimate the potential for reduction in performance and service life for pavements (jointed plain, reinforced and continuously reinforced) and structures subjected to various concentrated deicing brines.

Progress: Thin section specimens from the bridge decks examined previously prepared. All specimens for Task 6 have been placed in the appropriate solutions. Work at the University of Toronto continues on identifying distress mechanisms and determining scaling potential of various deicers.

Reports: Progress Report, August 2006

Implementation: The results of this research may be used to aid in the decision-making processes, with respect to the continued use of concentrated liquid deicers, while minimizing any potential damage to concrete pavements and structures.

Materials and Mix Optimization Procedures for PCC Pavements

Objective: The ultimate goal of this research project is to provide contractors and engineers with a set of guidelines that simplify and specify the process of producing affordable and durable PCC pavements. The guidelines will provide details on optimization of concrete mixing procedures when supplementary cementitious materials and other admixtures are used to modify the properties of concrete. The scope of this project is limited to materials commonly used by the Iowa DOT.

The specific objectives of the project include:

- Define the characteristics of a "good" concrete mix while still in the plastic state.
- Investigate effects of the key parameters of concrete mixing on fresh concrete properties.
- Develop guidelines for proper optimization of materials and mixing method/time.

Reports: Final Report, April 2006

Implementation: Implementation of the project results will be conducted through an implementation module structured for practicing engineers, technicians, quality assurance/quality control personnel, contractor superintendents, trade persons, and producers. Development of user guides and training sessions will be at the joint discretion of the Principal Investigator and PCC Center Advisory Board and Iowa Highway Research Board. In addition, the results will be incorporated for national distribution into the deliverables of the larger Material and Construction Optimization for Concrete Pavements program.

Innovative Solutions for Slope Stability Reinforcement and Characterization in Iowa Soils

Objective: The objectives of this research are as follows:

- Identify state-of-the-art practices for design, construction and maintenance of earth slopes to reduce slope instability problems on new embankments and backslope cuts.

 Develop recommendations specific to Iowa site conditions.
- Document several failure sites (5-10) where failures have been observed in order to better understand conditions that lead to instability in Iowa.
- Show the validity of and develop appropriate test procedures (i.e. Instructional Memorandums) for determining shear strength parameters using the Borehole Shear Test.
- Investigate and conduct simple pilot tests to evaluate various remediation techniques.
- Recommend design, construction and remediation alternatives for Iowa soil conditions to ensure slope stability of new embankment till and shallow backslopes.

Reports: Final Report, January 2006

Implementation: A summary sheet will be created and a PowerPoint presentation will be made at appropriate local/regional conferences to help in design, construction and maintenance operations.

Embankment Quality Phase IV - Application to Unsuitable Soils

Objective: Embankment Quality Phase IV research is to continue development and refinement of the QM-E program, but with effort focused specifically on "unsuitable" soils. This phase will provide additional *Grading Certification Level I* training of contractor and field personnel on two separate pilot projects - preferably one in western Iowa and one in southern Iowa. The outcomes of this phase will be 1) final recommendations for QM-E implementation; 2) a proposed Iowa DOT developmental specification; and 3) improved data management tools for contractor quality control (QC) and Iowa DOT quality assurance (QA).

Progress: The construction and data collection (Task 4) phase is still on going. Regular meetings have also been conducted to keep ISU personnel updated about the projects progress, address necessary questions, and develop plans for onsite data collection. ISU personnel have made approximately 20 trips to the site in the past 3 months. Activities have mostly involved independent QA testing, the primary focus of which has been DCP and moisture testing. To date more than 80 DCP/moisture tests (approximately 10% the contractors test total) and 30 moisture tests have been completed. Proctor, sieve analysis, Atterberg limit, and expansion index tests have also been conducted and analyzed. A new DCP calculation sheet was created for the contractor's quality control specialist to assist in calculating proper DPI values. The new sheet provides a more efficient, reliable, and quick means to calculating DCP test values. Data collection will continue through the 2007 construction season.

Reports: None

Implementation: The results of this research and pilot studies will be used as a basis for developing statewide specification changes for improved roadway embankments.

Performance Evaluation of Steel Bridges - Phase II

Objective: There are two primary objectives to the proposed research: first, to study the performance of bridges with suspect or untested design details; and second, to develop a low-cost system for use by secondary road bridge owners to easily monitor the conditions of infrastructure.

Progress: The tasks have been completed. A final report is expected to be complete by early 2007.

Reports: None

Implementation: The product of this research will be a better understanding of two types of primary road bridges and the development of a low-cost monitoring system for secondary road bridges. With the behavior information for the primary road bridge, the bridge owner will likely gain confidence in the performance of two bridge types. Also, secondary road bridge owners will have a low-cost system for monitoring bridges for specific behaviors or events.

Field Testing of Railroad Flat Car (RRFC) Bridges

Objective: The primary objective of this research was to obtain more data on the structural behavior of additional RRFC bridges. When this project was initially proposed, only two RRFC demonstration bridges had been constructed and tested. Numerous other variables needed to be investigated. Refinement of the design methodology presented in TR-444 was needed, as well as the development of a load rating process for these types of bridges.

In June, 2005, the need to investigate continuous span RRFC bridges became apparent and thus an extension to the current project to include the testing of three continuous span bridges was proposed and approved by the IHRB.

Progress: The work associated with simple span railroad flatcar (RRFC) bridges has been completed. During the past year the majority of the work associated with continuous span bridges has also been completed. Two two-span RRFC bridges in Buchanan County were tested during the summer of 2006 and one three span RRFC bridge in Winnebago County was tested this fall. Analyses of the field load test data have been completed for the two Buchanan County RRFC bridges and are nearly complete for the Winnebago County RRFC bridge. A theoretical grillage analyses is currently being developed for use in developing design procedures for RRFC bridges. In addition to the design procedures, a rating procedure for multi-span RRFCs is being developed.

Reports: None

Implementation: The primary value of the proposed research is to provide counties with a bridge superstructure alternative that is relatively inexpensive and easy to install. Results of this investigation will improve the design methodology previously developed in TR-444. The rating methodology developed in this investigation will make it possible for county engineers and consultants to rate these types of bridges.

Optimization and Management of Materials in Earthwork Construction

Objective: The following are the objectives for this project:

- Through a forensic study of recent geotechnical problems and failures in Iowa, identify the impact of not doing material management and optimization.
- Determine appropriate parameter values to use in optimizing geotechnical system performance and material placement (i.e. shear strength, volumetric stability) in particular geotechnical applications, including subgrades, retaining structures, embankments, box culverts, and foundations.
- Develop guidelines (i.e. flow chart) for selection, mixing, stabilization and/or ground improvement of materials that provide desired engineering properties to obtain optimal performance for the various applications.
- Provide recommendations for Phase II pilot studies and development of design tools/software.

Progress: The Field and laboratory work is complete. The final report is currently being written. And will be complete mid-2007.

Reports: None

Implementation: In addition to the written report, a summary sheet will be created, and presentations will be made at appropriate local and regional conferences. The observations and conclusions from this study will provide recommendations for better management and optimization of on-site and select earth materials through the use of new ground improvement technologies. State, county, and local transportation agencies and contractors can implement the recommendations for improved geotechnical construction.

Evaluation of Long Term Field Performance of Cold In-Place Recycled Roads

Objective: The objectives of this research project are to develop an understanding of the following:

- How the engineering properties of CIPR material, the environment, traffic and subgrade conditions influence the performance of the CIPR pavement.
- How the engineering properties of CIPR material change over time.
- How the mix design and the construction methods influence the engineering properties of CIPR materials.
- A rational mix design method and construction quality control system that is generally accepted in Iowa.

Progress: The research has been completed and a final report is in preparation. The report is expected to be ready for presentation to the board in early 2007.

Reports: None

Implementation: The result of this study will allow transportation officials to make decisions with regard to cold in-place asphalt recycling with more confidence that those decisions will result in actual improvements in road performance. As road performance improves, road users will have more satisfaction with pavement condition and tax payers will obtain more cost effectiveness from transportation network investments.

Utility Cut Repair Techniques -Investigation of Improved Utility Cut Repair Techniques to Reduce Settlement in Repaired Areas

Objective:

- To identify pavement cost effective and durable patching techniques. Pavement patch techniques will be examined on existing urban streets and rural highways. Good and poor pavement utility repair techniques will be identified.
- Research and identify trench subsurface principles that minimize utility trench settlement or bridging of the trench in cold weather.
- Develop a best practices utility repair techniques manual for state and local jurisdictions, which is a synthesis of known field practices and/or documented research. A section of the manual will contain recommended requirements that can be used by jurisdictions in their utility permit process.

Reports: Final Report, February 2006

Implementation: The observations and conclusions from this study will provide recommendations on effective utility cut repairs. State, county, and city transportation agencies/jurisdictions can implement the recommendations for utility cut repairs. It is anticipated that the best practices manual will be incorporated as a chapter in the Statewide Urban Design Manual and the specification recommendations will be included in the Statewide Urban Specifications Manual.

Improving PCC Mix Consistency and Production by Mixing Improvements

Objective: To find optimal mixing procedures for production of a homogeneous and workable mixture and quality concrete using a two-stage mixing operation.

Specific Objectives:

- To achieve optimal mixing energy and time for a homogeneous cementitious material.
- To characterize the homogeneity and flow property of the pastes.
- To investigate effective methods for coating aggregate particles with cement slurry.
- To study the effect of the two-stage mixing procedure on concrete properties.
- To improve production rates.

Progress: Laboratory concrete testing is complete. Analysis of the field data obtained is being undertaken. Report preparation has begun to document the laboratory and field results. There has been difficulty in identifying and developing a full scale field test section. Due to difficulties in determining a field test location, the final report will be written on the laboratory work completed to date.

Reports: None

Implementation: The Iowa DOT will use this two-stage mixing operation in demonstration projects. This is intended to lead to development of a new specification for the process.

Agency:

Determination and Evaluation of Alternate Methods for Managing and Controlling Highway-Related Dust, Phase II - Demonstration Project

Objective: The objective of the proposed study is to evaluate the effectiveness of two dust control additives that have been used but subjected to limited systematic studies. The two suppressants are: ground asphalt shingles and soap stock (a soybean oil by-product). These materials will be compared with untreated sections, as well as lignin and calcium chloride that are currently widely used as dust palliatives.

Reports: Final Report, June, 2005

Implementation: The observations and conclusions from this study will provide recommendations on most effective dust control methods and materials. State, county, and city transportation agencies can implement the recommendations for maintenance of unpaved roads.

Thin Maintenance Surfaces - Phase III - Municipal Streets and Low Volume Rural Roads

Objective: The objective of the proposed project is to fully develop a thin maintenance surface technology transfer program specifically for municipal and secondary road personnel.

The program will be developed to fit the specific needs of the following groups:

- Municipal and county engineers
- Consulting engineers and contractors involved in secondary road and street maintenance
- Secondary road and street superintendents
- Officials involved in street maintenance for small municipalities

Progress: The research has been completed. A final report and manual are being finished up and will be presented to the board in early 2007.

Reports: None

Implementation: The technology transfer program will be based on the findings from Phase I and II of this research program. Researchers will work with a focus group of the target audience to develop effective material including report(s) and a manual of practice.

Agency:

Iowa State University

Principal Investigator:

Dale Harrington

Research Period:

December 1, 2003 to November 30, 2005

Research Board Funding:

Design Guide and Construction Specifications for NPDES Site Runoff Control

Objective: Update and publish a revised erosion control section in the SUDAS Urban Design Standards and Urban Standard Specifications in order to provide additional tools for designers and contractors to meet the requirements of National Pollution Discharge Elimination System (NPDES) Phase II Stormwater Regulations. Issue addenda to the two SUDAS manuals and place the contents of the erosion and sedimentation control on the Web. Assist Iowa DOT to upgrade its design standards and specifications for Iowa DOT's and counties' rural projects.

Reports: Final Report, July 2006

Implementation: This project will provide Iowa Municipal Separate Storm Sewer Systems entities and design engineers a reference and design handbook for selection and implementation of water quality based BMP for stormwater management. The design procedures and specifications should facilitate the adoption of water quality based stormwater management by Iowa communities.

AASHTO 2002 Pavement Guide Implementation Plan - Phases I and II

Objective: The objective is to formalize a process leading to an approved implementation plan by July 2004.

Reports: Final Report, May 2005

Implementation: The benefits that may accrue from this project include the following:

- A detailed analysis of the Design Guide by knowledgeable faculty and Iowa DOT staff.
- An examination of the data-readiness of Iowa DOT for implementation.
- A sensitivity study to identify those factors of specific importance to implementation in Iowa.
- A phased approach to implementation over four years, with which the background, the basics, the testing and use of the new guide can be developed in an orderly fashion.
- A training schedule for DOT and non-DOT users.

Laboratory Study of Structural Behavior of Alternative Dowel Bars

Objective: The objective of this research is to determine an improved test procedure to replace the AASHTO T253 procedure and the corresponding analysis to incorporate the modulus of dowel support based upon structural laboratory tests

Reports: Final Report, September 2006

Implementation: Implementation is to be done via recommendations to the following:

- State DOTs for improved dowel bar design
- AASHTO for an improved test procedure to replace the current T253
- FHWA for improved dowel bar design.

Agency:

Iowa State University

Design and Construction Procedures for Concrete Overlay and Widening of Existing Pavements

Objective: The objectives of this research are as follows:

- Conduct a structural analysis of the overlay and widening unit contributions to stress reductions and extended pavement life of the composite pavement.
- Develop construction guidelines for construction of thin concrete overlays and widening units and a catalog of designs employed.
- Develop overlay design procedures for the thin PCC overlays and widening units.
- Validate the structural and design procedure with field load tests and strain measures for the various pavement layers of the existing pavements.

Reports: Final Report, October 2005

Implementation: The results will be implemented through:

- Presentation of the design manual with city, county, state, and national groups during their annual meetings or through special workshops.
- Development of demonstration projects with specific county, city and state engineers in selected Iowa highway districts to illustrate the process.

Decision Support Model for Assessing Archaeological Survey Needs for Bridge Replacement Projects in Iowa

Objective: The Decision Support Model will leverage Iowa DOT's 30-year investment in archaeological survey to create a tool for evaluating the archaeological potential of bridge replacement projects. The following objectives will be achieved:

- Evaluate data from previous archaeological surveys of bridge replacements with regard to their ability to detect buried archaeological sites.
- Identify critical variables that influence the presence, preservation, and relative age of cultural deposits in a proposed bridge replacement's Area of Potential Effect.
- Develop a Decision Support Model that allows project planners and their archaeological consultants to apply the critical variables in evaluating the archaeological potential of proposed bridge replacement projects.
- Develop a handbook in pdf format containing guidance and best practices for using the Decision Support Model
- Develop recommendations for further research to improve, test, and extend the Decision Support Model.

Reports: Final Report, September 2006

Implementation: The Decision Support Model will be used at the local level by city, county, and district engineers, at the state level by State Historical Preservation Office and Iowa DOT, and by archaeological and engineering/environmental consultants at the individual project level. Self-training will be provided to some extent by the User's Manual, but some amount of hands-on, instructor-led training may also be needed.

Development of a Manual of Practice for Roadway Maintenance Workers

Objective: The objective of this project is to prepare a maintenance practices manual for county road workers and supervisors for use as a training and reference tool. The manual will be topical with each maintenance activity covered in a short chapter that will offer concise information targeted to equipment operators (backhoe operators and truck drivers) and other workers who actually perform the maintenance work. Ideally, the chapters would form the backbone for a "tool box talk" safety and training program.

Reports: Final Report, June 2006

Implementation: Presentations to introduce and explain the handbook will be made to county engineers and transportation professionals at conferences and workshops. The manual will be highlighted in Iowa's Local Technical Assistance Program (LTAP) publication, *Tech News*, and technical articles will be developed incorporating the research findings. It is anticipated a one-day workshop on the manual will most likely be developed, and will be provided for maintenance workers at many locations around the state over the next several years through the Iowa LTAP.

A Guide for Monitoring and Protecting Bridge Waterways Against Scour

Objective: The objective of this project is to prepare a comprehensive, well-illustrated, and practical manual that will substantially help engineers in monitoring, maintaining, and protecting bridge waterways so as to mitigate or manage scour occurring at the bridge structures.

Reports: Final Report, April 2006

Implementation: The primary product of this project will be a practical manual that will aid engineers to monitor bridge waterways. If deemed necessary, the manual could be introduced and explained in a workshop setting.

Waterway scour threatens bridge abutment and embankment.

Agency:

Iowa State University

Principal Investigator:

David J. White

Research Period:

May 1, 2004 to April 30, 2008

Research Board Funding:

\$40,000

100% State -75% Primary funds, 15% Secondary funds and 10% Street funds

Measurement of Seasonal Changes and Spatial Variation in Pavement Subgrade Support Properties - A Link to Pavement Performance

Objective:

- Conduct field tests on newly compacted subgrade (after construction and prior to paving) to document spatial variation in stiffness parameters,
- Monitor changes in subgrade stiffness due to seasonal variation in moisture and temperature, and
- Measure the influence of matric suction (difference of pore air pressure and pore water pressure) and the water content of the soil in the laboratory to establish a database for Iowa soil types.

Progress: Instrumentation data are still being collected. A case study is being conducted to measure the temperature, moisture content, frost depth, and depth to water table on a completed project on US 20. The case study aims to document the measurements of changes in engineering properties of subgrade materials due to spatial and seasonal effects.

Reports: None

Implementation: The resulting technology transfer will be incorporated into the final report of the Embankment Quality Phase IV TR-492 project. It is envisioned that the conclusions will be used as a basis for developing proposed statewide specification changes.

The research findings and conclusions will be disseminated through electronic distribution of the final report, the Iowa DOT and CTRE's Websites, and through local/regional presentation. It is also expected that the final recommendations will be implemented at the national level through publication of technical papers and presentation at TRB in Washington, D.C.

Agency:

University of Nebraska - Lincoln

Principal Investigator:

Dean L. Sicking and Ronald K. Faller

Research Period:

April 1, 2004 to January 31, 2005

Guidelines for Safety Treatment of Roadside Culverts

Objective: General guidelines will be developed for safety treatment alternatives for cross-drainage culverts. Costeffective analysis procedures will be utilized to determine traffic characteristics and roadside geometries for which each of the above safety treatments are most costbeneficial.

Progress: This project involves identifying the benefits of implementing various safety treatments for roadside culverts. Although the project was originally intended only to examine the benefits of extending culverts, the scope of this project changed when safety grates were successfully tested on 3:1 slopes. This scope change caused the project to be delayed. The Roadside Safety Analysis Program (RSAP) has been used to determine the important variables that affect the benefits of the various safety treatment options. RSAP was then run to identify the actual benefits associated with each option over the range of each important variable. RSAP results are currently being compiled and the final report will soon begin to be drafted.

Reports: None

Implementation: Generalized guidelines for safety treatment of cross-drainage culverts will greatly simplify development of plans for 3R projects. These guidelines will provide reasonably accurate and consistent safety treatment designs for roadside cross-drainage culverts. Further, the simplified design guidelines will significantly reduce the effort required to develop safety treatment plans for roadside cross-drainage culverts.

It is anticipated that the Iowa DOT will be able to immediately implement the simplified design guidelines developed under the study proposed herein. A short seminar will be presented at the end of this study in order to train Iowa highway designers in the application of the guidelines.

Monitoring Wind-Induced Vibrations/Stresses in a High-Mast Lighting Tower

Objective: A high-mast tower in the I-35/US 18 interchange near Clear Lake needs to be instrumented and monitored for at least one year to determine the type of vibrations and stress ranges that are being induced at various wind velocities. The natural frequencies and damping characteristics of a number of towers also need to be determined.

The objective of this research is to collect long-term behavior information on the performance of one of the eight high-mast lighting towers in the I-35/US 18 interchange near Clear Lake, IA, for the purpose of validating assumptions made by others in an analytical investigation of these and similar towers.

The natural frequencies and damping characteristics of a number of towers need to be determined because they are very important in the investigation/evaluation of towers.

Progress: This project has been completed. A phase II study (TR-562) began in mid 2006. The draft final report is currently under review.

Reports: Draft Final Report, December 2006

Implementation: The research will likely provide information to revise/improve the AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaries, and Traffic Signals. This, in turn, would improve the design of future new towers and the retrofit of existing towers not only in Iowa but nationwide.

The research has the potential to result in considerable savings for the Iowa DOT in inspection manpower and tower retrofit/replacement costs.

TR-519 Phase II

Implementing a StreamStats Web Site for Iowa and Developing Flood-Estimation Equations for Small and Large Drainage Basins

Objective: The objectives of this proposed amendment to Project TR-519 are to develop a comprehensive flood-estimation method for unregulated, rural streams in Iowa. Specific objectives are to:

- Implement an interactive StreamStats Web site for 100 percent of Iowa that allows users to easily select stream sites and estimate flood-frequency discharges by automating the measurement of basin characteristics and calculation of regression estimates.
- Develop two sets of regional regression equations to estimate 2-, 5-, 10-, 25-, 50-, 100-, 200-, and 500-year flood-frequency discharges.
- Develop the smallest drainage-area range for a transition zone as possible for Iowa to prevent the possibility of small-basin regression estimates exceeding large-basin regression estimates.

Progress: The objectives for phase I have been accomplished. Additional phase II funding for the implementation of StreamStats was approved and work has begun.

Reports: None

Implementation: This study will provide a flood-estimation method that will enable engineers, managers, and planners to estimate flood-frequency discharges for small drainage basins with great predictive accuracy. Regional regression equations developed in this study will only include basin characteristics that are considered easy for users to apply. The probabilistic rational method of flood estimation developed in this study will present runoff coefficient and rainfall frequency maps of the state from which users will determine runoff and rainfall values for small drainage basins. The study will produce a standard USGS Scientific Investigation Report that will describe the study and present example applications of flood-estimation methods.

Evaluation of Dowel Bar Retrofits for Local Road Pavements

Objective: This research seeks to provide the following:

- Evaluate the feasibility of using elliptical or round dowels to retrofit an 8" depth local road pavement as part of a retrofit/grind rehabilitation project.
- Evaluate the impact of applying two, three or four dowels in the outer wheel path only on pavement performance.
- Evaluate the impact of utilizing FRP or steel dowels in the retrofit of the test pavement, on long-term performance.
- Determinate the relative cost of elliptical shaped dowels (FRP and steel) for the retrofit project.

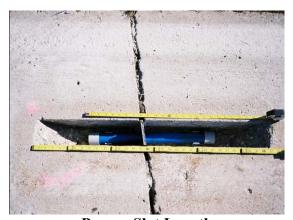

Progress: Construction of the test sections is complete. Annual performance evaluation and testing is being conducted.

Reports: Construction Report, February 2006

Implementation: The report will provide guidance to counties and cities on the following:

- Relative number of dowels per joint required to achieve a given level of performance.
- Relative costs versus performance of the various dowel material types.
- Potential benefits of dowel bar retrofits versus overlay alternatives for this type of pavement rehabilitation.

The results of this research are expected to provide guidance to local government officials in the use of dowel bar retrofits as a method of rehabilitation. This will provide local governments with an alternative to extensive overlays or reconstruction of such pavements.

Investigation of Steel Stringer Bridges: Substructures and Superstructures

Objective: The objective of this proposed investigation is twofold: Development of procedures for assessing, rehabilitating, strengthening, and replacing inadequate substructure components or entire substructures; Develop methods to more accurately evaluate and rate noncomposite, steel stringer, concrete deck bridges

Progress: Testing of the proposed six bridges has been completed. Rating of these bridges by a consulting firm has also been completed. It will be possible to compare the ratings from the DOT and the consultant with the ratings that were completed by the research team. The research team ratings include both a theoretical rating, and a performance based rating using the field test data obtained from the testing of the bridges. The portion of the final report compiling the rating information and the results from the field tests is nearing completion.

Pile Integrity tests were performed at one bridge in Mahaska County to determine the in-service pile length or major defects below the ground level. The tests were conducted near the abutments to determine the adjacent soil profile which will be used to determine the soil characteristics, which will in turn be used in a numerical modeling study for this bridge. The research team is currently waiting on the delivery of FRP so that several pile strengthening schemes can be investigated.

Reports: Quarterly Report, November 2006

Implementation: By employing the substructure evaluation procedure, bridge owners will be able to evaluate the strength of the elements in various types of substructure. Procedures for replacing deficient substructure elements or the entire substructure will be developed.

By using the rating factor developed in this part of the investigation, it will be possible to more accurately evaluate existing non-composite-steel stringer concrete deck bridges. In some cases it should be possible to remove posting and obtain several more years of service from a particular bridge.

Design Guide for Improved Quality of Roadway Subgrades and Subbases

Objective: The objective of this investigation is to analyze, synthesize, and present, in a practical design guide, the findings of recent research relating to subbase and subgrade from Iowa and other states. The design guide will be incorporated into the Iowa DOT and SUDAS manuals.

Construction practices for subgrades and subbases will be reviewed and analyzed so as to identify typical problems that can occur due to poor construction practices. An assessment of stabilization and treatment techniques in relation to construction of subgrades and subbases will be conducted with the goal of selecting reliable geotechnical and foundation treatments. The purpose and expected outcome of best practices for different subgrade and subbase types and treatments will be outlined.

Progress: The TAC has met multiple times to get the design guide sections completed. It is anticipated that the guide will be finished shortly.

Reports: None

Implementation: The conclusions and design guide from this study will provide recommendations on roadway subgrade and subbase design. The design guide and integrated best practices will be incorporated as a chapter in the Statewide Urban Design Manual and the specification recommendations will be included in the Statewide Urban Specifications Manual.

In addition to the written report, a summary sheet and a PowerPoint presentation will be created for dissemination through SUDAS and the Iowa DOT. The study's findings and conclusions will be disseminated through electronic distribution of the final report, CTRE's website, and through presentations made at appropriate local/regional/national conferences.

Feasibility of Cooperative Development of Wetland Mitigation Projects

Objective: The objectives of this project are to:

- **1.** Determine the need for cooperative wetland mitigation projects.
- **2.** Identify resources
- **3.** Develop a conceptual framework to facilitate more centralized wetlands mitigation strategies that would reduce costs and improve effectiveness.

Reports: Final Report, February 2006

Implementation: A workshop will be held with the assistance of LTAP on cooperative development of wetland mitigation projects for the purpose of publicizing the recommended framework and beginning the process of creating a working procedure for cooperative development of wetland mitigation projects.

Guidelines for Removal of Traffic Control Devices in Rural Areas

Objective: The objective of this research is to study the effectiveness of rural stop control with a goal of developing warrants that can be used to support engineering decisions made by county and rural city staff to reduce or eliminate unnecessary control.

Reports: Final Report, December 2005

Implementation: As much as possible, technology transfer will be leveraged by making it part of other ongoing efforts by state and local technical organizations. The final report will be available to all interested parties. The FHWA may be interested in investigating the recommended criteria for inclusion in the MUTCD

Development of a New Process for Determining Design Year Traffic

Objective: The objective of this research is to improve civil engineering design in terms of more consistent roadway performance over the life of the project. This will be accomplished through developing an alternative and more detailed method to develop traffic projections, to create tools which allow for scenario planning, to embrace the traditional planning process and evaluate alternative methods to using existing long range models, and to improve the overall relationship between planning and civil transportation design.

Progress: The research is finished and preparation of a final report is underway.

Reports: None

Implementation: These research findings will result in an example methodology along with the actual tools needed to conduct scenario planning and development of traffic forecasts. The results have the potential to change the way traffic impact studies are conducted in allowing for the review of impacts much further away from a new site than the adjacent intersections.

Construction and Evaluation of a Prestressed Concrete Bridge Using Ultra-High Performance Concrete

Objective: The overall objectives of the work are to:

- Advance the state-of-the-art in concrete bridge construction technology by constructing the first bridge in the United States to use a novel concrete mix.
- Develop experience in the State of Iowa in the design and construction of bridges using advanced materials.
- Develop recommended design procedures for the shear design of ultra high performance concrete beams.

Progress: The Bridge has been constructed and is open to traffic. The laboratory portion of the project is complete. A field test plan has been developed and the first field load test will be conducted in the late summer of 2006.

Reports: None

Implementation: These new advances will be of use to all jurisdictions within Iowa as they will ultimately reduce costs by taking advantage of:

- 1) a higher strength material and
- 2) a material with almost zero permeability which could essentially eliminate deterioration of bridge decks.

The result of these advances will ultimately be in the form of design recommendations and specifications that would likely be adopted by the American Association of State Highway and Transportation Officials.

Development of an Improved Integral Bridge Abutment-to-Approach Slab Connection

Objective: The objectives of this project are as follows:

- Develop an effective approach slab-to-integral abutment connection detail for use on Iowa bridges
- Install a structural monitoring system to document and assess the performance of the connection detail and its effects on overall bridge performance

Progress: Construction of the bridge and installation of the instrumentation is complete. Behavior monitoring has begun and will continue over two winter seasons.

Reports: None

Implementation: The successful development of an integral abutment-to-approach slab connection will be useful to all jurisdictions within Iowa. This improved connection detail will be incorporated into the Iowa DOT standard bridge plans and utilized for state, city and county bridge projects throughout the state.

Effective Shoulder Design and Maintenance

Objectives:

- Identify practices for design, construction and maintenance of granular shoulders that result in reduced rutting and drop-off, improved safety, reduced maintenance costs, and extended performance life with recommendations specific to Iowa materials and conditions.
- Document several granular shoulder sites where poor and good performance has been observed in order to better understand the factors contributing to shoulder problems.
- On a pilot basis, evaluate and compare the performance of several test sections using chemical stabilization and mechanical reinforcement techniques including application of waste and recycled materials in construction.
- Perform a cost/benefit analysis to investigate owner costs of alternative systems.

Progress: Multiple shoulder projects were constructed during the year with a variety of stabilization practices tested. These included geosynthetics, soybean oil, Portland cement, fly-ash and others. Each site was tested over time for structure and evidence of rutting or drop-off.

Reports: None

Implementation: The observations and conclusions from this study will provide recommendations on best practices and maintenance procedures used on granular shoulders. State, county and city transportation agencies/jurisdictions can implement these recommendations. The results of this project will be implemented when 1) specifications and Materials Instructional Memoranda are updated to reflect the findings, and 2) transportation officials make improved project selection decisions by selection of more effective construction materials.

Evaluation of Transverse Joint Forming Methods in PCC Pavement

Objective: The objective of this research is to evaluate currently available and conceptual joint forming equipment and methods for transverse joints. The goal is to find a method that can be efficiently and cost effectively employed at the time of pavement construction to form transverse joints (or induce the vertical crack that acts as a joint) in a dowelled or plane concrete pavement.

Reports: Final Report, February 2006

Implementation: The results of this research are not applicable. Test sections did not produce cracks as was hoped. The test sections were sawed after a few weeks.

Evaluation of Design Flood Frequency Methods for Iowa Streams

Objective: The objective of this project is to assess the predictive accuracy of two standard design flood methods, the Rational Method and the NRCS (or SCS) method, for flood frequency estimation on Iowa streams. The evaluation will be based on comparisons of flood frequency estimates at sites with sufficiently long stream gage records.

Progress: A set of 46 streamgages was chosen from the Midwest region, each with a drainage area of 200 acres or less and 20 or more years of record. A flood frequency was estimated for each site using standard statistical methods. Watershed characteristics were collected and stored for each of the 46 basins; and the flood frequency was estimated using the Rational Method and the NRCS curve number approach. Comparisons of the design methods were made to address the differences and an alternative flood frequency estimation technique was developed in order to mitigate the differences between the two design methods.

Reports: Quarterly Progress Report, September 2006

Implementation: The results of this project will be most relevant to city and county engineers, who are frequently engaged in design and planning of stormwater management facilities for changing land use conditions. Research findings will be presented to the Iowa Stormwater Comprehensive Workgroup, which plays an advisory role in SUDAS. The evaluation may result in specific recommendations for changes in the current SUDAS procedures.

Design Procedures and Field Monitoring of Submerged Barbs for Streambank Protection

Objectives: 1) Model hydraulically the performance of a proposed submerged barb design for the US-169 bridge site. 2) Perform a comprehensive field study involving the design, installation and monitoring of submerged barbs at the same site.

Progress: The study utilizes a commercial Surfacewater Modeling System (SMS) software package with a 2-D solver to evaluate the large scale effects of the design. Quantitative and qualitative evaluation based on previous fundamental studies showed the Iowa DOT design effectively reduced the flow-induced shear stress, velocity, and depth along the river bank. Results also showed the current Iowa DOT design will produce adequate sedimentation between structures and effectively move the bank line back towards its historic location. Future results from the continuation of this study will help to further reduce the ambiguity of barb design. Two field seasons have been completed and sonar is being used to monitor the scour holes. The final stage includes comparisons of field and modeling results and identification of any discrepancies between the two.

Reports: None

Implementation: The results of this research will provide:

1) Specifications on the range of flow conditions that are detrimental for bank erosion and scour around barb structures. 2) A classification of barbs based on their hydraulic performance under various flow conditions. 3) Criteria regarding the stability of the structures for future design recommendations. 4) A detailed technical report describing the performance of the recommended structures, as well as summarizing the performances of alternative

structures.

Reuse of Lime Sludge from Water Softening and Coal Combustion Byproducts

Objective: The objectives of this project are as follows:

- 1. Obtain evidence that shows that using lime sludge stabilized with fly ash and mixed with bottom ash will not harm the environment if used as a fill material.
- 2. Obtain additional data for direct shear testing and California Bearing Ratio (CBR) so that a conclusive analysis can be completed.
- 3. Continue testing for strength, density, moisture, and temperature variation on the test embankment built in July 2004. Without the measurements in the spring, a comparison of data before and after a full season of freezing and thawing cannot be made.

Reports: Final Report, September 2005

Implementation: The final report contains the information needed for highway design engineers and professionals to use for project design. These designers will use the results to design structural fills for highway projects where lime sludge is available at a reasonable transportation expense. Designers will have the ability to determine necessary material amounts using the research information.

Implementation of the Water Quality Control BMPs and Design and Specifications Manuals

Objective: The objective of this project is to incorporate the content of the new best management practices and design and specification manuals for erosion and sediment control measures (currently under development through project TR-508, "Design Guide and Construction Specifications for NPDES Site Runoff Control") in the existing web-based erosion control expert system.

Progress: The manuals to be incorporated in the interactive website are:

- 1. Iowa Construction Site Erosion Control Manual
- 2. Statewide Urban Standard Design and Specification Manuals for Erosion and Sedimentation Control
- **3**. Design of Guidelines and Specifications for Improving Stormwater Water Quality

The Best Management Practices and Design and Specification Guidelines for Erosion and Sedimentation Control have been incorporated into the interactive manual. The Water Quality part is still under development.

Reports: None

Implementation: Once finalized, the Iowa Stormwater Runoff Control Interactive Manual (ISRCIM) will be transferred on one of the IDOT existing web servers. Strong outreach, testing and upgrading activities are envisioned during the dissemination of the ISRCIM to a wide category of users. Major role in this regard will play the training programs incorporated in Part 3 of research project TR-508, "Design Guide and Construction Specifications for NPDES Site Runoff Control." Additionally, training sessions on ISRCIM use will be organized according to requests formulated by IHRB, Iowa cities and counties, and other specialized state offices with responsibilities in the area of sediment, sedimentation, and water quality control.

Iowa Data Collection and Analysis for the 2005/2006 National Surface Characteristics Field Experiment Plan

Objective: The objectives of this research are as follows:

- 1. To design, procure, build, test, and evaluate various concrete pavement texture patterns that address noise reduction in relationship to friction, smoothness, and texture, as well as their time rates of change in service.
- **2.** To analyze data from over 35 existing sites in the U.S., benchmarking Iowa values.
- **3.** To develop best practice guidance to Iowa for optimizing texturing, balancing noise considerations with friction and smoothness.

Reports: Final Report, February 2006

Implementation: The outcome of the project will include a set of best practices that can be used to improve the means of texturing concrete pavements in the State of Iowa. It is anticipated that these best practices will work within the bounds of the new FHWA Technical Advisory on "Surface Texture for Asphalt and Concrete Pavements". The best practices are anticipated to identify pavement surfaces that are not only quieter, but do not compromise safety, smoothness, or performance.

Implementation of these best practices will be accomplished with a cooperative effort between industry, the PCC Center and the Iowa DOT. Their application can be the subject of stand-alone workshops and/or a component of existing technology transfer activities already underway.

Using Scanning Lasers for Real-Time Pavement Thickness Measurement

Objective: The principal objective of the research is to develop the algorithms that can process real time laser scanning data to create an accurate 3D model of the pavement that can then be used to determine pavement thickness at any point. Such a device may potentially greatly reduce the need for state DOTs to take cores in order to assess this aspect of quality. A device such as this can also be considered for in process control of the paver since real time concrete depths will be calculated. This method may eliminate the need for the owner and contractor to take depth measurements during the paving process.

Reports: Final Report, June 2006

Implementation: A non-destructive system will greatly reduce the need to take core samples after the paving process is complete. Also, this system will provide a much denser sampling of thickness measurements, which will increase accuracy of the quality control program. Having real time feedback on actual pavement thickness means that the contractor does not need to pave at a higher than specified thickness to assure that the contractor meets the specifications.

Other direct benefits will be the cost savings from not needing to do pavement depth checks during the paving operation (both contractor and owner). This sensor will be able to provide real time depth measurements as a profile of the concrete will be generated. Volume of concrete in place will be easily determined using this approach. The system would fit on any paver that can provide position coordinates and may be retrofitted onto a paver by using relative position control. It is also possible that if the point cloud is sufficiently dense, pavement smoothness can also be determined using this approach.

Instrumentation and Monitoring of Precast, Post-tensioned Bridge Approach Pavement

Objective: A structural health monitoring system will be installed to document and evaluate the performance of a precast, post-tensioned approach pavement and its effects on overall bridge performance. The research team will install a monitoring system to collect overall bridge movement and bridge component strain data over an extended period of time of more than two years. Evaluation of performance will be formulated through comparisons with recognized codes and standards including the AASHTO specifications.

Demonstrating the benefits of a precast, post-tensioned approach pavement through this pilot project may provide an opportunity for the Iowa DOT to successfully pursue CPTP funding for accelerated construction of other precast concrete pavement projects under the FHWA Highways for Life program.

Progress: Construction of the bridge and installation of the instrumentation is complete. Behavior monitoring has begun and will continue over two winter seasons.

Reports: None

Implementation: The successful development of a Precast, Post-tensioned bridge approach pavement system will be a useful extension to the proposed integral abutment-approach slab connection that is currently being studied by the research team under IHRB project TR-530. An improved approach pavement system may be incorporated into the Iowa DOT standard bridge plans and utilized for bridge projects throughout the state.

These results will be distributed to the engineering community through the publication of technical papers in the engineering press and presentations at bridge and transportation conferences, and through posting of pertinent information on the website of the Office of Bridges and Structures and the website of the Bridge Engineering Center.

Developing Guidance for Use of Lighting on Rural and Urban Roadways in Iowa

Objective: The main goal is to provide agencies in Iowa with information and guidance on the use of lighting so that cost-effective decisions can be made. Objectives include summarizing existing lighting guidelines, documenting good lighting practice, quantifying the effectiveness of roadway lighting in reducing the number and severity of night-time crashes, comparing roadway lighting to other safety measures, such as pavement markings, rumble strips, etc. and providing information to decision-makers to select strategies to reduce night-time crashes from among a range of alternatives and developing recommendations for the use of roadway lighting

Progress: During this fiscal year, the researchers participated in several workshops on lighting fundamentals. A synthesis of the state of the practice is nearly completed as well as a thorough literature review. Researchers have obtained and summarized warrants for street lighting for 20 states and conducted a lighting survey of Iowa counties. They've collected safety data for around 350 rural intersections. A Bayesian analysis of the safety data is about 80% complete.

Reports: None

Implementation: The project will result in a lighting guidance document that will be incorporated into SUDAS. The guidance document will provide a rural and urban application matrix which recommends where roadway lighting should be prioritized based upon roadway, land use, safety, and traffic conditions. The lighting guidance document will provide the following information:

- A description of what good lighting is
- Summary of available and applicable design standards or warrants used by other national, state, and local agencies
- Recommendations on where lighting is likely to be the most effective and when other strategies, should be considered to provide night-time guidance to drivers
- Recommendations on type, configuration, and layout of lighting to address glare and other issues as well as use resources cost effectively
- Information to allow agencies to determine the costs and benefits of installing lighting

The Effects of Headcut and Knickpoint Propagation on Bridges in Iowa

Objective: Recent research suggests that headcuts and knickpoints, where they form and migrate, account for 60 percent or more of the bed erosion in susceptible streams. The objective of this research is twofold: 1) Understand the processes causing formation and migration of headcuts and knickpoints in the field, and 2) Develop a sound but practical model that predicts the formation and migration of headcuts and knickpoints, and associated scour.

Progress: The design phase of the project has been completed and preliminary measurements regarding knickpoint migration have been obtained. An intense field monitoring effort is continuing which entails the following activities:

A. Select fixed (e.g. sedimeter, eco-sounder) and portable (e.g. ADV, Large-Scale Image Velocimetry) instruments to survey the scour processes.

B. Specify the location for scour measurements and the field procedures used in the monitoring.

Existing laboratory measurements by the University of Iowa suggest that within a hole, two distinct recirculation patterns form. Mapping of the eddy structures has been completed which is believed to cause the migration of the knickpoints.

Reports: None

Implementation: Knowledge of the initiation of knickpoint formation will allow the design and construction of grade-stabilization structures at an early stage before sizeable knickpoints have developed.

The specific products of the project will be 1) A practical manual what will aid engineers in monitoring knickpoints, and 2) The development of a model that will predict migration rate and scour depth of knickpoints.

Development of Continuous Concrete Slab Bridge Standards

Objective: The Department proposes to develop the county "J" standard slab bridge plans. This project involves bringing the superstructure portion of the current three-span continuous concrete slab bridge secondary road standards 24' and 30' (MJ7200-95 and MJ9000-95) into conformance with the LRFD Specifications, updating the current standards into compliance with Office of Bridges & Structures Design Manual and Policies, and creating new J-Standards for additional roadway widths of 40' and 44'.

Bridge lengths are to include: 70', 80', 90', 100', 110', 120', 130', 140', and 150'. Skews are to include 0°, 15°, 30°, and 45°. The task involves 144 different combinations of lengths, skew and widths. Bridges will carry open rails or F-section rails, except the 24' width will only prescribe open rails. Bridges will have integral abutments and either pile bent piers. Substructure design shall be in accordance with the 17th Edition of AASHTO Standard Specifications. The intent is to have the standards completed by October 31, 2006.

Reports: Completed Bridge Standards, November 2006

Implementation: The detail sheets are available to all Local Jurisdictions in Iowa, as well as the Iowa DOT, in Microstation and PDF format on the Iowa DOT Web page. Cost savings from using these standards rather than using individual consultant designs for each bridge would then be available for use in other parts of the roadway network.

Development of Three Span Prestressed Concrete Beam Bridge Standards

Objective: This project involves bringing the superstructure portion of the current three (3) span prestressed concrete beam bridge secondary road standards (H24-87 and H30-94 Standards) into conformance with the LRFD specifications, updating the current secondary standards (H24-87 and H30-94) to comply with the Office of Bridges & Structures Design Manual and Policies, and creating new H-Standard for additional roadway widths (40'-0" and 44'-0"). The attached file shows the matrix of the 135 different combinations of lengths, skews and widths.

Progress: 100% final standard plans have been submitted for the H24, H30, and H40 series. The 100% final standard plans should be submitted in December 2006 for the H44 series. Final acceptance and availability of the full set of standards should occur in early 2007.

Reports: None

Implementation: The detail sheets are available to all Local Jurisdictions in Iowa, as well as the Iowa DOT, in Microstation and PDF format on the Iowa DOT Web page. Cost savings from using these standards rather than using individual consultant designs for each bridge would then be available for use in other parts of the roadway network.

Development of Self-Cleaning Box Culvert Designs

Objective: The objective of this project is to identify and/or develop methods for constructing, or retro-fitting box culverts so that the typical flow through a culvert will clean the culvert's barrels and keep the structure performing well with little or no maintenance.

Progress: Site visits were organized at multi-barrel culvert sites that have sedimentation problems to learn more about the origin of sedimentation process, techniques presently used for cleaning culverts and for gathering input as to specific ideas for culvert cleansing that could be tested in the laboratory testing associated with this project. Ample reports regarding the site visits were prepared. Following the site visits, it was realized that the nature of the sedimentation processes at visited sites is more complex than originally envisioned. Specifically, the culverts presenting problems are of the low-headwater type, some culverts draining adjacent catchments through ephemeral streams. The site findings required additional literature review dealing with this particular type of culverts. Using the input gathered from the site visits, a series of laboratory experiments are currently under design and construction. The laboratory tests are effective way to identify, develop, and confirm conceptual methods for culvert self-cleansing. Given the complexity of the sedimentation processes for low-headwater culverts, is was however concluded that the laboratory results have to be associated with a set of numerical simulations to fully clarify the combination of flow conditions leading to the culvert sedimentation.

Reports: None

Implementation: The methods identified will be limited to those that can be contained within the right-of-way of the roadway under which the culvert passes. It is anticipated that the results of the project will be applicable to culverts in general. These results should be of practical benefit at both the state and local levels

Investigation of Electromagnetic Gauges for Determination of In-Place Density of HMA Pavement

Objective: To establish the accuracy and precision of the PQI model 301 electro-magnetic gauge manufactured by Trans-Tech and the PaveTracker model 2701 electro-magnetic gauge manufactured by Troxler as compared to cores.

The secondary objective is to investigate the use of these gauges for determining differences in density at and near the longitudinal joint and in areas of segregation, when observed.

Progress: The research team has completed the field sampling and field testing of the mixes. Slabs for 10 of the 15 mixtures have been made and tested with the remaining to be made in the near future. The first three of six tasks are complete.

Reports: Quarterly Report, September 2006

Implementation: Based upon the completion of the above objectives, a determination of the ability of newer, non-nuclear technologies to replace core samples for evaluating in-place asphalt pavement density will be performed.

Assuming a non-nuclear device or system is identified as a suitable replacement of core samples for evaluating in-place asphalt pavement density, an implementation plan will be developed to include recommended calibration procedures, methods for assessing measurement variability, and routine operation of the device or system for Iowa DOT.

Investigation of the Impact of Rural Development on Secondary Road Systems

Objective: This project is quantifying the traffic and fiscal impacts of two common types of rural development on the secondary road system in Iowa. The two types of development are rural residential subdivisions, which are commonly found 30 minutes or less from centers of employment, and livestock production facilities, which are typically located in more remote areas.

Progress: The residential portion of this project is just about finished. A significant rework of the assumptions underlying the residential portion was undertaken after consultation with county engineers.

The second part of this project focuses on farming operations. This is about half finished. The scope has enlarged somewhat due to the emergence of ethanol plants on the scene.

Reports: None

Association of Counties and its affiliated groups, the Local Technical Assistance Program (LTAP), Iowa State Extension to Communities, Iowa Chapter of the American Planning Association, and other associations and agencies who serve these groups to disseminate information about the results of the research and knowledge of how to use the impact tool. The research team will work with Extension and LTAP to develop a series of informational workshops on the topic of rural development impacts on transportation networks

Roadway Design Standards for Rural and Suburban Subdivisions

Objective: A preliminary search of county websites indicates that only 28% of Iowa counties have specific subdivision public improvement requirements. The Statewide Urban Design and Specification (SUDAS) and Iowa DOT manuals do not have geometric standards for rural cross-sections on low-volume, low-speed facilities.

This project will determine what standards are currently in place in Iowa and surrounding states for street geometrics, pavement cross-section, width and thickness, as well as the type of facility needed to handle drainage.

Progress: The research began with submittal of a questionnaire to County Engineers and Zoning Administrators concerning existing requirements for subdivision and connecting roadway paving. Thirty-four responses were received. Following discussion of the survey results and appropriateness of regulations, the Committee drafted roadway design parameters for the road in the subdivision and the connecting roadway.

Reports: None

Implementation:

Once the recommended standards are determined, they will be reviewed by the SUDAS program's District SUDAS Committees and Board of Directors and ultimately be incorporated into the SUDAS Design Manual, Chapter 5 (Roadway Design), to provide additional geometric design guides and design criteria associated with rural and suburban developments.

Performance Evaluation of Rubblized Pavements in Iowa

Objective: Based on IHRB project TR-473, the primary objective of this study is to evaluate the structural condition of existing rubblized concrete pavements across Iowa through Falling Weight Deflectometer (FWD) tests, Dynamic Cone Penetrometer (DCP) tests, visual pavement distress surveys, etc. Through backcalculation of FWD deflection data, the rubblized layer modulus values will be determined for various projects and compared with each other for correlating with the long term pavement performance. The results will be useful in establishing design modulus and for providing AASHTO layer coefficient recommendations for rubblized PCC layers.

Progress: During this phase of the project, research efforts have been focused on completing the literature review, identifying the rubblized pavement sites in Iowa, organizing a Technical Advisory Committee (TAC) meeting in mid April, and preparing and submitting a technical paper related to the structural analysis of rubblized concrete pavements using neural networks based pavement layer backcalculation models. Efforts were also undertaken to categorize the identified rubblization sites based on Iowa DOT District maps.

In addition, rubblized pavement site visits have been coordinated with the Special Investigation Office of the Iowa DOT to start the pavement coring, FWD (Falling Weight Deflectometer) testing and DCP (Dynamic Cone Penetrometer) testing along with visual pavement distress mapping in September and October of 2006.

Reports: None

Implementation: The results of this study, if favorable, could result in better estimates of the minimum HMA overlay thickness required for rubblized concrete pavements. If successful, the Iowa DOT and the counties may implement the validated procedure for design of HMA overlay thickness for rubblized concrete pavements.

Local Agency Pavement Marking Plan

Objective: The study assists local agencies which rely heavily on contractors for application of pavement markings by producing a Reflectivity Guideline to assist in identifying needs due to wear or marking damage over the winter and in developing marking needs and priorities each spring, in addition to:

- **1.** Application Matrix Develop a County and City pavement marking application matrix which will provide guidance on the selection of marking materials based on roadway type, pavement service life, user needs, and other factors specific to local agency conditions.
- **2.** Quality Control Address quality control issues for Cities and Counties to improve the efficiency and effectiveness of pavement markings on all marked public roadways.

Progress: Researchers have ordered and received the LTLX retro-reflectivity machine and have been using it in the field to get used to the device. They have presented a project work plan to the TAC. The City of West Des Moines will be one of the case studies and beginning work to collect community pavement marking information. Researchers have developed and conducted a survey with 33 counties responding and 8 cities. Additional follow-up calls will be made to communities as well as with industry.

Reports: None

Implementation: The findings of this research will be shared through presentations at the County Engineer conference, ASCE Transportation Conference, APWA conference, and through a variety of other professional, municipal, and national group presentations. The guidelines developed could eventually be incorporated into a pavement marking design section within the SUDAS manual.

Field Evaluation of Timber Preservation Treatments in Iowa Highway Applications

Objective: Evaluate the performance of different wood preservatives in the field. A particular focus will be placed on preservative treatments used in Iowa, although additional information at the national level, where pertinent to Iowa, will also be included in the project scope. Current specifications and testing procedures will be reviewed and correlated with inspection findings in an effort to assess adequacy of initial treatment and the effects of treatment barrier compromise on durability. Recommendations will be made following this assessment.

Progress: The project investigators, including faculty and staff from Iowa State University and the USDA Forest Products Laboratory, conducted a comprehensive literature search to document previous timber preservative procedures applicable to Iowa bridges. The Project Advisory Committee has also been formed.

The research team also conducted a survey of the 99 county engineers from Iowa to ascertain their timber bridge inventory, preservative practices and document their successful and problem timber bridge details. A series of site visits to document bridge details reported in the survey is planned for Fall/Winter 2006.

Reports: None

Implementation: The involvement of the Forest Products
Laboratory who provides national support to various
governmental agencies related to wood systems, it is
anticipated that many other states and counties will be
interested in the results of the project. Information will be
distributed to the wood utilization community and
preservation industry through publications in the industry
literature.

Agency:

Examination for Curing Criteria for Cold In-Place Recycling

Objective: To further Iowa's development of asphalt recycling technology, this study explores technically sound and more effective ways to identify minimum in-place CIR properties necessary to permit placement of the HMA overlay or chip seal

Progress: A contract has been initiated between the Iowa DOT and the University of Iowa to conduct the research.

Reports: None

Implementation:

Research efforts focus on procedures that will minimize the CIR exposure time while retaining the potential for the owner agency's investment to succeed, which is to minimize the risk of CIR layer and HMA damages. One of the procedures to be researched is a maturity curve for CIR layer under various curing conditions. The research will develop a better analysis tool that the industry and the owner agency can apply to monitor the CIR layer in preparation for a timely placement of the wearing surface.

Performance and Evaluation of Concrete Pavement Granular Subbase

Objective: The research will determine if recycled PCC pavement subbase is performing adequately by evaluating representative pavement sections with comparisons to virgin aggregate subbase sections (in particular with respect to the specification changes since 1992) and evaluate the variation in subbase stiffness and permeability by performing multiple tests within a given test section using semi non-destructive methods (i.e. permeability measurements through core hole, pavement FWD tests, and down hole LWD and DCP tests).

The research will also determine the gradation of the subbase materials using bag samples and non-destructive X-Ray CT scanning of epoxy filled core samples and characterize the ride quality and geometric characteristics of the pavement layer for correlation to the subbase properties. Evaluation of the pavement drainage system at each test section site by inspecting the subdrain outlets will be made with development of suggested material guidelines and specifications for construction of pavements using recycled PCC aggregate for subbase.

Progress: Contract initiated.

Reports: None

Implementation: The conclusions of this study will provide recommendations on the use of recycled PCC aggregate as subbase. The Iowa DOT, county, and city transportation agencies/jurisdictions will be responsible for implementing the findings and recommendations.

Laboratory and field test results will be summarized in figure and table format and include recommendations for material properties and construction practices.

Evaluation of Hot-Mix Asphalt Moisture Sensitivity Using the Nottingham Test Equipment

Objective: This project evaluates the moisture susceptibility of the individual components of HMA through an experimental plan which will isolate different variables. Dynamic Modulus and Flow Number testing will be used to evaluate the moisture susceptibility of the HMA.

Research objectives include:

- 1. Compare the test results for materials tested in a moisture saturated environment and a dry environment. The research plan will integrate a range of Iowa DOT asphalt mixtures.
- **2.** Use the results obtained from the Dynamic Modulus and Flow Number Tests to develop a new test protocol for determining moisture susceptibility.

Progress: Field mixes have been collected and the mixtures have been characterized. A preliminary plan for shakedown testing has been developed. The literature review has been completed and will be updated periodically.

Reports: Quarterly Report, September 2006

Implementation: Several products will be developed from this project. The research team will deliver clear and concise recommendations on acceptable test protocol conditions and limitations along with appropriate user variability in the draft final and final reports. The final report will include an executive summary. The research team will also provide quarterly progress reports to the Technical Advisory Committee. The research team will also evaluate different anti-stripping agents.

The implementation plan will include recommendations for integrating moisture testing. The research project will also evaluate different anti-stripping agents and their success in mitigating moisture damage. The technology developed as a result of this study will be delivered in an electronic, via a compact disc, and paper form.

Feasibility Investigation of Segmentally Precast Bridge Piers for Accelerated Construction

Objective: To simulate, evaluate and test several component materials, connection details, and component configurations to identify the most cost-effective and structurally advantageous means of constructing a radically different design approach of segmentally precast bridge piers for accelerated construction. The basic proposed pier assembly features steel belts at the ends of segments, external reinforcement of segment joints which have bolted connections, and bearing pads between segments to avoid labor-intensive grouting procedures

This steel belt assembly serves three purposes:

- 1. Reinforcement of fragile concrete corners
- **2.** Confinement of the concrete at the ends of the segments to provide additional concrete strength and ductility
- **3.** Convenient and aesthetically pleasing means for the connection of the exterior reinforcement plates

Progress: The project start date was May 1, 2006, so the project was still in the very early stages as of the end of the fiscal year. As of June 30, 2006, literature review was ongoing, arrangements for participation of members to serve on the Technical Advisory Committee were being made, and initial planning for laboratory testing was under way. The project is on schedule, and no significant problems have been encountered.

Reports: None

Implementation: Results of the research would include costbenefit analyses of varying materials and component configurations, calibrated analytical models for future designs, and recommendations for full-scale field prototype demonstrations.

Evaluation of Lignin Derived from Agricultural Co-Products as an Antioxidant in Asphalt

Objective: To evaluate the potential anti-oxidant activity of lignin and evaluate the technical viability of the concept. To achieve the project goal, the research will address specific aspects of the technical evaluation of the concept.

Specifically, the proposed research will:

- **1.** Determine the antioxidant activity of lignin in asphalt for lignins that are currently available or are anticipated to become available in the future
- **2.** Evaluate the range of applicability of the concept to determine if the activity is beneficial in a number of asphalts.

Progress: Some preliminary blending and testing has been completed. Initial results indicate that high levels of lignin have an emulsifying effect on the binder. However, lower levels of lignin do not show this emulsifying effect. The research team is investigating whether moisture present in the lignin is creating the emulsifying behavior.

Reports: Quarterly Report, September 2006

Implementation: Successful completion of the proposed research will provide the technical validation required to continue with a more rigorous research and development activity, which will include a series of performance-based laboratory tests and a demonstration of the concept in a field trial of new highway construction.

Use of Ultra-High Performance Concrete in Geotechnical and Substructure Applications

Objective: A quarter of our nation's 590,000 bridges, including their substructures, are currently classified as structurally deficient or functionally obsolete, primarily due to material deterioration. This is driving the engineering community toward designing durable bridges and infrastructures that can last for a minimum of 75-years with minimal maintenance. To achieve longer life of bridges, new and innovative materials needs to be used. Ultra-High Performance Concrete (UHPC) provides a unique combination of durability, strength, ductility and aesthetic flexibility, which can not only improve longevity of the bridges, but can produce cost-effective solutions in the long run. Iowa is one of the pioneering states in the use of UHPC in bridge superstructure applications. The unique engineering properties of UHPC show great potential for producing durable foundation elements, which in turn will lead to longer lasting substructures and soil stabilization remedies in different condition. The research aims to investigate and evaluate the use of UHPC for geotechnical applications related to transportation structures.

Progress: During this fiscal year the team has been working on:

1) literature review, 2) design the laboratory test set-up, 3) analytical procedure to evaluate the drivability of UHPC piles. This research project is getting national attention. At a recent Prestressed/Precast Concrete Institute (PCI) conference Federal Highway Administration engineers showed interest in the research project and suggested a few ideas that may be incorporated in the current project in increase the value of the project beyond the boundaries of the State of Iowa.

Reports: None

Implementation: The conclusions of this study will provide recommendations on the use of UHPC in geotechnical applications related to transportation facilities for Iowa engineers.

Improved Method for Determining Wind Loads on Highway Sign and Traffic-Signal Structures

Objective: To obtain information on the airflow around highway sign and traffic signal structures and then to estimate the unsteady forces and moments acting on them using state-of-the-art Computational Fluid Dynamics (CFD) tools including Large Eddy Simulation (LES), to perform structural analysis of the highway sign and traffic structures subjected to these loads, and to study new design ideas for the panels that will include a certain number of holes to reduce the pressure forces acting on them under strong wind conditions.

Additionally, there is a need to determine how best to minimize wind loads on structure supporting signs and lights. Several options are available for doing this:

- Develop improved shape and dimensions of signs and their support structures
- Develop air-flow panels (panels with holes disposed on a certain pattern) to reduce wind loadings (especially drag form) and addition of flow-modifying fixtures.

Progress: Contract Initiated

Reports: None

Implementation: The report will present the methodology (e.g., description of CFD and structural analysis codes, parameters, boundary conditions, assumptions, etc.), definition of test cases and presentation of simulation results, comparison among the numerical methods, design recommendations, relevance for other problems of interest to DOT in a clear manner that is easy to understand for practicing engineers. The essential benefit resulting from the project would be a better understanding of the effects of wind on highway sign and traffic signal structures including a dynamic analysis of the aeroelastic effects and the degree to which the presence of holes disposed in a certain pattern over the main plate of these structures can reduce the wind loads.

Clear Zone – Synthesis of Practice and Benefits of meeting the Ten-Foot Clear Zone Goal on Urban Streets

Objective: To determine the state of the practice of clear zone design guidance (standards) and the experiences other jurisdictions have had with applied clear zone guidance; to identify experience in other jurisdictions with clear zone guidance with respect to application of traffic calming designs and/or context sensitive solutions, and to observe the benefits or drawbacks in Iowa that have resulted from providing ten feet of clear zone or from providing less than the ten foot goal.

Progress: Contract Initiated

Reports: None

Implementation: The project will produce a concise report and a technology transfer brief, and if invited, the investigators will make presentations at the Iowa ASCE transportation engineering conference, the Iowa APWA Chapter conference, and the MOVITE chapter of ITE biannual conference

The principle benefit of this project will be a better understanding of the benefits of meeting the ten foot clear zone goal and the costs of providing something less than ten feet. The result should also help the Iowa DOT clarify their policy on clear zone width so that there is less uncertainty in the process of whether a project that does not meet the ten feet goal will or not be approved.

Laboratory and Field Testing and Evaluation of Precast Bridge Elements

Objective: Perform testing and evaluation of precast components for three separate bridge projects to assess overall design, construction, and bridge structural performance. The research team will design and install monitoring systems and perform laboratory structural tests on bridge specimens that represent structural details for use on the three projects.

Progress: Boone County: Two test specimens have been constructed and tested. All of the specimens tested to date have strength four to five times the design strength. The third set of substructure test specimens has been cast. Also, a test has been developed to check and analyze the leveling process used in the field to level the deck panels.

Blackhawk County: The first abutment cap has been service load tested and loaded to failure. The closure pour for the first set of connection tests has been completed. The second set of connections has been completed and is waiting for the closure pour. The formwork for the third set of connections has been assembled.

<u>Madison County:</u> The casting of the box girder sections has started. The research team is currently installing corrosion monitoring sensors in each of the production girders. Two additional box girders will be cast for testing in the ISU structures laboratory.

Reports: None

Implementation: Demonstrating the benefits of precast, posttensioned bridge components through this project may provide an opportunity for the Iowa DOT and Iowa County Engineers to design and construct more cost-effective and durable bridges. The benefits derived from developing accelerated construction concepts may also be significant.

Field Instrumentation and Testing of High-Mast Lighting Towers in the State of Iowa

Objective: The Iowa DOT owns 233 high-mast lighting towers ranging from 100' to 180' tall. In 2003, a 140' tower collapsed due to a fracture at the welded connection at the base plate. Subsequently, cracks were found in twenty other towers. In addition to the cracks at the base plate, a crack was also found at the welded access opening detail on one tower. The cracked towers were removed from service.

The goal is to determine how the reinforcing jacket affects the tower's response to wind induced vibrations and to also determine the magnitude of stresses in both the jacket and the original tower, including the anchor rods.

Progress: The contract executed June 14, 2006 to instrument and monitor a bolted, reinforcing jacket on a tower in the I-35/US18 Interchange near Clear Lake.

The instrumentation was installed during the last week of June. The stresses induced by wind will be monitored for 12 months.

The instrumentation is providing information as intended from the original tower shell, the jacket and the anchor rods.

Reports: None

Implementation: The research will likely provide a more cost effective repair to cracked high-mast towers and a more efficient retrofit for un-cracked towers with fatigue susceptible details. The Iowa DOT would be able to expeditiously address the problems associated with these towers at a large cost savings.

Secondary Road Research Coordinator

Objective: To maintain research liaison with all county engineers and solicit new, innovative and progressive ideas; to actively promote secondary research for solutions to problems and ideas that will improve quality and reduce costs

Progress: Ed Engle continues visiting with many county engineers to discuss problems being encountered by the secondary road departments and to discuss present research projects during the year. At present, there are approximately 40 active research projects that involve counties, including secondary projects with consultants. The coordinator assists these counties with special testing, evaluation, and writing of construction and final reports necessary to the research. He has also been keeping county engineers updated on the changes in the IHRB operating procedures.

Reports: None

Implementation: There are many problems that are unique to the secondary road system in Iowa. These problems are usually common to several counties. Coordination between counties is necessary for understanding the problem and formulating solutions. Proper documentation and dissemination of reports allows for timely technology transfer between the counties.

Development of In-Situ Detection Methods for Material Related Distress (MRD) in Concrete Pavements, Phase II Extension

Objective: The research is designed to evaluate and develop methods to detect and quantify material-related distress in PCC pavements by completing the following: 1) Identify current techniques (preferably nondestructive) that can be used to identify the condition of the aggregates and the cement paste throughout the depth of the Portland cement pavement at any given time in the life of the pavement.

2) Identify the gaps in the current NDT methods for identification of MRD. 3) Evaluate the most promising MRD methods identified in the Phase I effort.

Reports: Final Report, August 2005

Implementation: The results of the previous Iowa research and development efforts and the evaluation of the MRD methods should be communicated to the general highway industry through newsletters, electronic media and workshops for the ICPA, ICEA, and APWA members.

The method developed for distress identification should be demonstrated through workshops in various parts of the state for consultants, state and local government persons to view.
